Executive summary

Brazil has brought virtual asset service providers inside the National Financial System. Providers already operating in the country must file for authorization with the Banco Central do Brasil by 30 October 2026.

At this stage, readiness depends as much on operating evidence as on documentation. Controls need to be in place, tested and producing records before independent assurance can begin.

The phase 1 application requires eight documents under IN **BCB 704 art. 9**, including three years of CVM-audited financial statements. Resolution **520 art. 88** sets the deadline at 270 days from 2 February 2026.

Filing has immediate commercial consequences. From 30 October, BCB-supervised institutions may not transact with a provider that is neither authorized nor in the authorization process. This covers payment accounts, transactions, custody, intermediation and virtual-asset foreign exchange.

Filing also starts reporting. IN BCB 713 requires **CADOC 5711** every business day and **CADOC 5710** monthly, both submitted as XML through the BCB file transfer system. **DeCripto** is already required monthly.

Phase 2 adds independent assurance. IN **BCB 739** requires a reasonable assurance report from a CVM-registered audit firm testing whether AML, counter-terrorist-financing and **UNSC** asset-freezing controls work in practice. Controls therefore need to be operating and producing evidence before assurance begins.

Phase 1 approval starts a second clock. Applicants have 60 days to submit phase 2 documentation, extendable by up to another 60 days.

2 February 2026

The rules enter into force, and the 270-day filing period begins.

30 October 2026

Deadline to file the authorization application with the Banco Central do Brasil.

60 days

Time to submit phase 2 documentation after phase 1 approval, extendable by up to 60 more days.

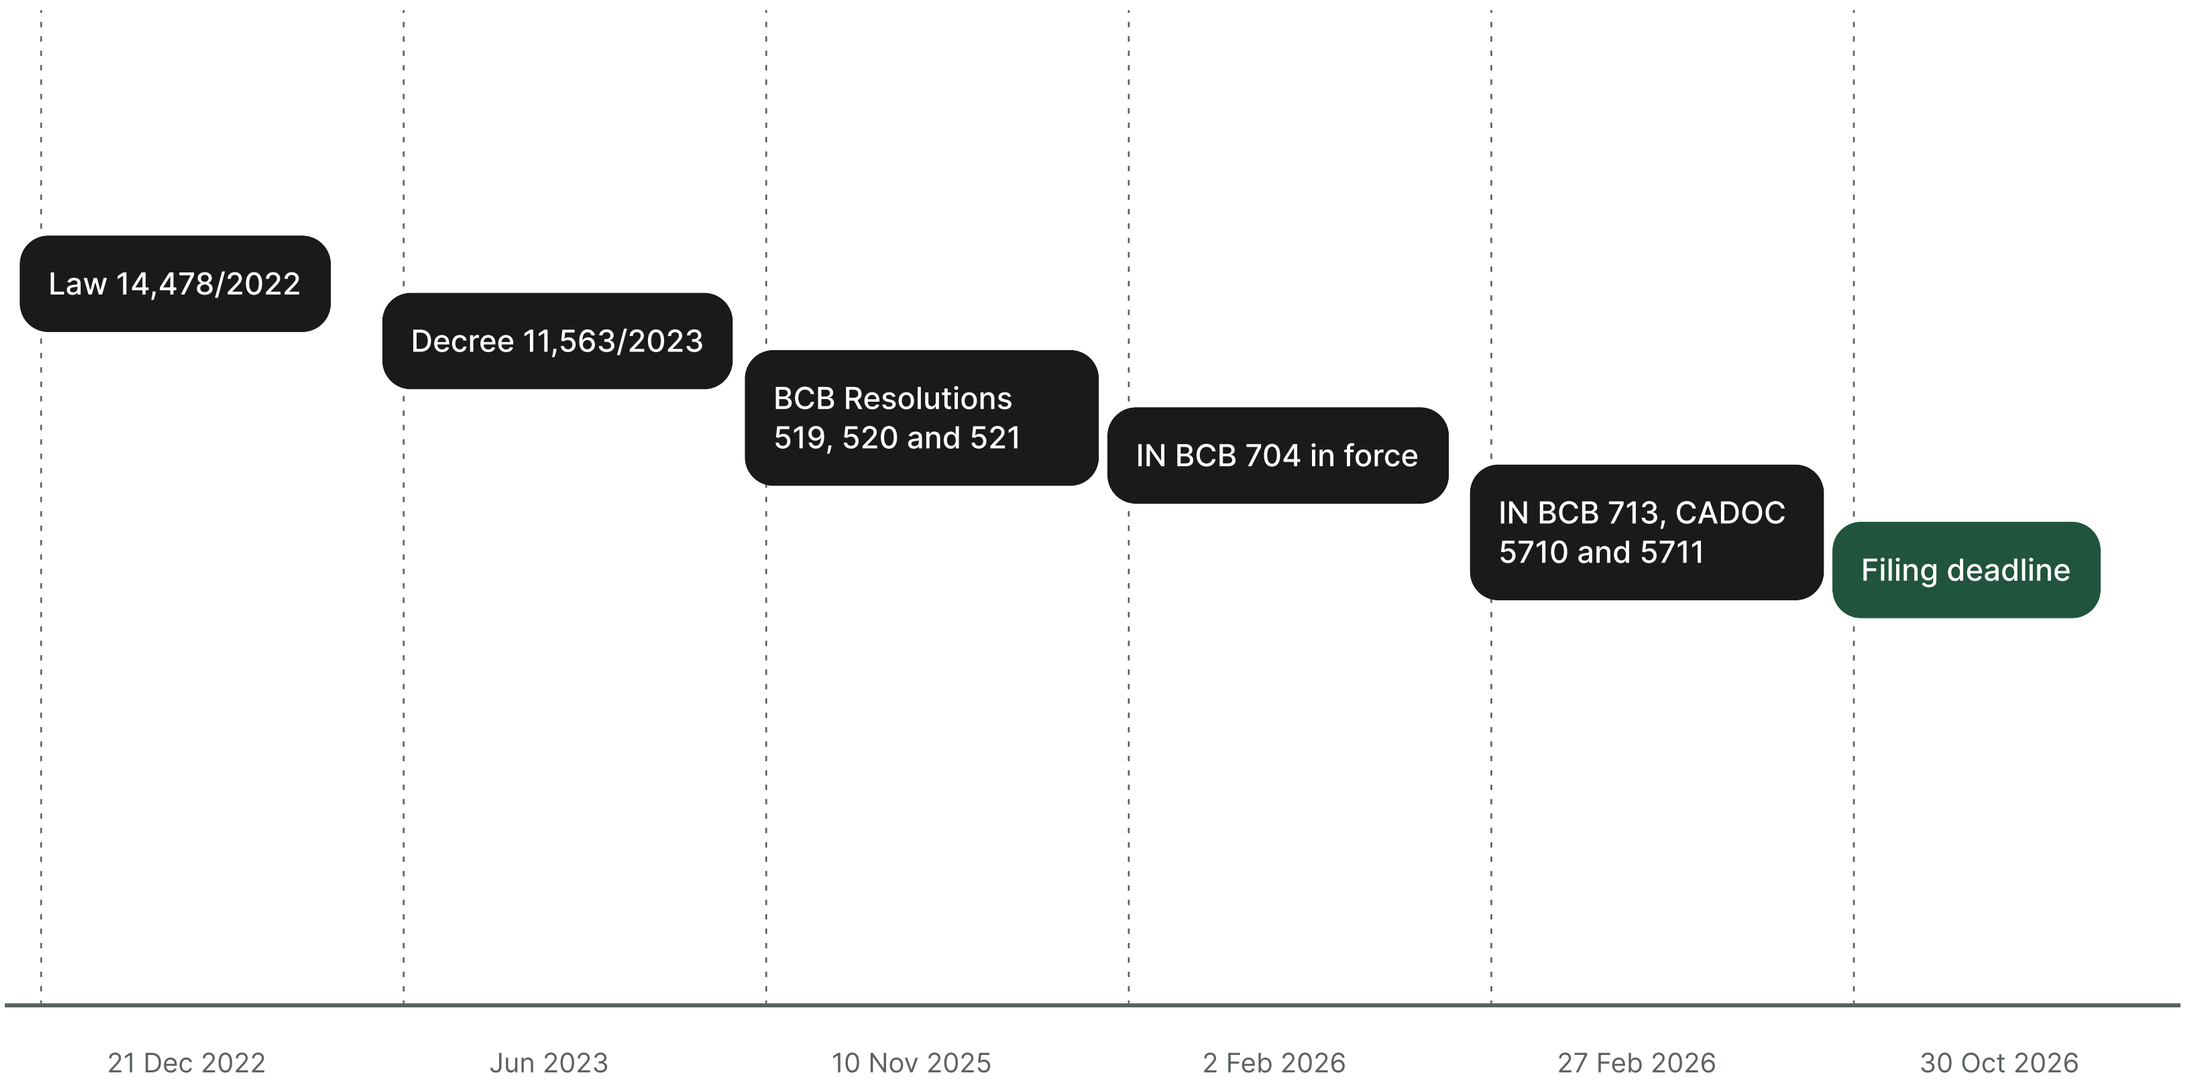

The regime in one page

Instrument	Date	What it does
Law 14,478/2022	21 Dec 2022	Defines virtual assets and virtual asset service providers, sets the guidelines, delegates the design to the Executive
Decree 11,563/2023	Jun 2023	Names the BCB as the competent authority to regulate, authorize and supervise
BCB Resolution 519	10 Nov 2025	Governs authorization processes, including for foreign exchange brokers and securities dealers
BCB Resolution 520	10 Nov 2025	Creates the SPSAV in three categories: intermediary, custodian and broker, the last combining intermediation with custody. Art. 88 governs the adequacy period for firms already operating, including the 270-day filing deadline and the interim reporting duty
BCB Resolution 521	10 Nov 2025	Classifies virtual-asset international payments and transfers as foreign exchange operations, amending Resolution 277
Joint Resolution 14 (CMN/BCB)	3 Nov 2025	Replaces fixed floors by institution type with a capital methodology driven by the activities a firm actually performs
IN BCB 704	in force 2 Feb 2026	Sets the authorization procedure, documents and deadlines on two tracks
IN BCB 701	2026	Defines the route for incumbent banks and dealers, requiring independent technical certification
IN BCB 713	27 Feb 2026	Establishes CADOC 5710 and 5711, the reporting obligations that begin at filing
BCB Resolutions 552 and 553	3 Mar 2026	Fold SPSAVs into the pre-existing prudential, accounting, audit, compliance and cybersecurity rulebooks, with implementation by 30 October 2026
IN BCB 739	29 May 2026	Adds the reasonable assurance report to the dossier, as a phase 2 document for a firm already operating
RFB IN 2,291/2025 (DeCripto)	from Jul 2026	Requires monthly reporting to the Receita Federal, aligned to the OECD CARF and reaching foreign providers serving Brazilian clients

A firm already structured for Europe, Dubai or Singapore will recognize the core requirements: authorization, capital, segregation, governance and AML. Brazil also incorporates FATF standards directly. Resolution 520 art. 47 ties its lists of high-risk jurisdictions to FATF designations, while the assurance report requires enhanced diligence for jurisdictions under FATF monitoring. The main difference is timing: independent verification sits inside the authorization process rather than after approval.

The rules describe an institution, not just a technology platform. Resolution 520 art. 14 requires at least three directors accountable to the BCB for business conduct, AML and CFT, internal controls and compliance, risk and capital management and cybersecurity. One director may hold multiple responsibilities where there is no conflict, so the rule creates a minimum headcount of three rather than five separate roles.

Resolution 519 art. 11 adds a residency requirement. For the registered office, art. 2 requires premises under the institution's effective and exclusive use. Coworking spaces, virtual offices and shared premises are prohibited, except where the space is shared by institutions within the same conglomerate.

Which activities require authorization

The perimeter is defined by function rather than technology. A service sits inside it when it is provided to third parties, involves a virtual asset under the legal definition rather than a security and involves trading, transferring, custodying or offering. If any of the three is absent, the service sits outside.

Clearly outside: proprietary mining, proprietary treasury management, software that neither custodies nor intermediates and advisory work that never touches client assets. National and foreign currency, electronic money, loyalty points and securities are excluded from the definition, and securities stay with the CVM.

The genuine uncertainty concentrates at the edges:

> **Wallets and infrastructure:** Control of keys is the dividing line. Purely non-custodial software is not custody, but assisted recovery, shared-key schemes and multi-party computation arrangements in which the provider joins the signing fall on a spectrum. The custody boundary decides whether a technology company carries regulatory capital and a dedicated registered office at all.

> **Payment companies and fintechs:** Where the customer experience belongs to the fintech but the virtual asset service is performed by a partner, the obligation has to be located and written into the contract. Crypto-as-a-service answers part of this and turns the rest into diligence on the partner's regulatory standing.

> **Tokenizers:** The question is which regulator applies. Parecer de Orientação CVM 40, from 2022, sets the functional test for when a crypto-asset is a security. Separately, the CVM stated in 2026 that SPSAV authorization does not permit offering tokenized shares, derivatives or crypto futures.

> **Gaming and NFTs:** Game assets without a payment or investment purpose tend to fall outside. A game token listed with a liquid secondary market and an appreciation story does not.

> **DeFi interfaces:** A genuinely decentralized protocol with no identifiable provider escapes practical licensing. A Brazilian commercial interface that acquires users, charges fees and routes orders comes functionally close to intermediation.

Serving Brazil from abroad

Article 23 of Resolution 520 required entities incorporated abroad already serving the Brazilian market to transfer operations and clients to a locally authorized vehicle within 270 days of the effective date. The remaining routes are to authorize a local vehicle, acquire an authorized operation or one already in process, act as a contractor to an authorized provider or leave the market.

What the application actually requires

The dossier answers five questions:

Question	What the BCB expects
Who owns the company, and where	Identification and qualification of controllers, with proof of economic and financial capacity and of the origin of funds
What does the company intend to do?	A business plan in the format of IN 704's annex, consistent with the intended category
How does it govern itself?	Statutory officers with named responsibilities, formalized policies, dedicated physical registered office
What capital stands behind it?	Minimum capital under the Joint Resolution 14 methodology, computed from the activities actually performed
How does it protect clients and the system?	Asset segregation, cybersecurity, business continuity and the AML apparatus

Phase 2 tests whether the controls actually work

IN BCB 739 added a reasonable assurance report to phase 2. A CVM-registered audit firm must assess control design, test effectiveness and gather evidence from the business. Policies on paper are not enough.

That makes operational readiness critical. If the dossier describes controls that are not yet working, the assurance engagement is designed to find that gap.

Two areas matter in particular. **Segregation** must be demonstrable at any time, with client funds and virtual assets kept separate from the firm's own. **AML controls** must be running in production, with evidence of monitoring, screening decisions, UNSC asset-freezing checks and the firm's risk matrix.

The **Travel Rule** follows a separate timetable. Resolution 520 art. 44 defines the required originator and beneficiary data. Art. 89 phases implementation in domestically by 2 February 2027 and across borders by 2 February 2028. Until then, documented client self-declarations may be used.

The practical implication is to **start phase 2 work before phase 1 is approved**. The BCB has no minimum review period. Once phase 1 clears, the 60-day deadline for phase 2 begins immediately, whether the applicant is ready or not.

Phase 1

30 October 2026

The phase 1 filing includes eight documents under IN BCB 704 art. 9, including three years of CVM-audited financial statements.

Phase 2

60 days

Applicants then have 60 days to submit phase 2 documentation, which may be extended by up to another 60 days.

Reporting starts the day you file

The filing date starts a recurring reporting obligation that continues until the BCB decides on the application.

	CADOC 5711	CADOC 5710	DeCripto
Frequency	Every business day	Monthly	Monthly
Base date	23:59 Brasília	Month end, 23:59 Brasília	Month
Deadline	3 business days	5 business days	Per RFB instruction
Content	Custody positions per client, per asset and per network, plus 14 COSIF account balances	Verifiable proof of reserves and staking, by asset	Reportable transactions, CARF-aligned
Format	XML over the BCB file transfer system, document code SAV5711	XML over the BCB file transfer system, document code SAV5710	Per RFB instruction

The sequencing and the precision are what make this schedule hard to hold.

Both documents are sequential. The previous base date must be accepted before the next is received. A rejected file therefore blocks the next one, with no catch-up path, while the review continues. On a daily document, that stops submission the next business day.

Positions are reported per client, and omnibus wallets aggregate clients by design. Per-client positions have to be derived and reconciled rather than read.

Precision is unforgiving. Quantity fields carry up to 42 digits with 32 decimal places, which must survive every upstream source and every intermediate system. Value fields carry 18 digits with 2 decimals.

Quality review comes after acceptance. Once a file is accepted, the CRD system applies quality rules and emails its findings directly to the director named in Unicad.

The layer the regulation does not describe

Regulation defines the controls. Supervision asks for evidence that those controls worked, for each client and each reporting date. The difficult part is the operating layer in between: producing one reconciled record that can support every obligation.

A single client stablecoin position can feed four requirements.

Segregation requires the balance to remain separate from the firm's own assets. CADOC 5711 reports it by client, asset and network, using the required identifiers. CADOC 5710 uses the month-end position to support proof of reserves. DeCripto reports the transactions that created or changed it. Four obligations, but the same underlying data.

If each report is assembled separately from custodian exports, exchange statements and wallet data, the same position is effectively rebuilt several times.

Nothing guarantees the results will match. Because CADOC 5711 is sequential, one rejected file can block the next submission until the discrepancy is resolved.

That gets harder when a provider operates across custodians, wallets, exchanges, payment providers and banks. A small internal team and an external accounting firm can produce the reports manually, but the process becomes part of the authorization risk itself.

The regime does not require software. A spreadsheet can work until a file is rejected or an auditor asks where a number came from, who approved it and what evidence supports it.

One client's stablecoin position on one base date

read by four separate obligations

Segregation	CADOC 5711	CADOC 5710	DeCripto
a balance that must sit in a wallet separate from the firm's own, within tolerance	a quantity per client, per asset and per network	at month end as part of a reserve that has to be demonstrably backed	the transactions that moved it

A readiness checklist

These test the evidence your controls produce, rather than the controls themselves.

	Question	What a "no" costs
1	Can you demonstrate the client position today, reconciled between your internal record and the on-chain record, without manual consolidation?	The 5711 base date becomes a manual project, every business day
2	Can you produce per-client positions out of an omnibus wallet for an arbitrary past base date?	Re-filing and CRD findings land on the named director
3	Do 5711 quantities carry full precision from the source system into the file, with no rounding step in between?	Schema validation fails and the sequential chain stops
4	Could you produce a schema-valid 5711 for yesterday's base date this afternoon, without a person assembling it?	The 3-business-day deadline depends on individual availability
5	If a file were rejected, would you know why before the next base date closed?	One rejection becomes a multi-day outage in the filing chain
6	Is there a named person accountable for the reconciliation underneath all five answers above?	The accountability the regime assigns has no operational owner

A negative answer does not necessarily mean the control is missing.

More often, the control exists but the evidence is not yet being produced, a gap that typically surfaces during assurance or examination.

Statutory directors ask about three architectural decisions before they ask about any feature.

01 **We do not transmit.** Your director does. Range prepares and validates; the responsible director submits, under your own credentials, and remains accountable for what is filed. The regime holds a named person responsible, so the file should leave from that person.

02 **Your clients' CPFs never leave your systems.** Range works on opaque internal references. Identifiers are matched inside your own infrastructure at the final step.

03 **Nothing reaches the BCB until it has been right for a week.** Shadow mode runs the full control on schedule and delivers nothing, so you go live on a file you have already watched work.

Where Range fits

Range is the platform for companies operating across stablecoins and fiat. We start from the reporting requirements, here the 5710, 5711 and DeCripto schemas, and translate them into controls that run on the regulator's calendar. We connect the custodians, exchanges, banks and compliance providers you already use rather than replacing them, and run the monitoring, reconciliation and reporting off one record.

Positions arrive from every source into one record per client, per asset and per network. Wallet state reconciles against your books on every base date, so breaks surface before a file is built. Each base date leaves an evidence trail: what the data was, who reviewed it, who approved it. A counterparty appearing as a wallet, a bank account and an exchange deposit address becomes a single record, so one screening posture covers every rail it appears on.

Whether you're preparing your SPSAV authorization or managing ongoing BCB reporting, Range helps keep the underlying data, controls and evidence ready for review.
