Predictions For The Stablecoin Value Chain (2027–2030)	10

Executive Summary

For most of their history, **stablecoins** were a tool for crypto traders parking value between trades. That era is over. In 2026, dollar-pegged tokens have become a settlement layer that moves more money than the world's largest card networks, and the conversation inside finance teams has shifted from whether stablecoins work to where in the value chain a company should plug in.

The headline numbers make the case.

Stablecoins settled roughly $33 trillion in on-chain transaction volume in 2025, surpassing the combined $25.5 trillion processed by Visa and Mastercard (Source: crypto.news). Total stablecoin supply reached about $316 billion by April 2026, up 54% from the start of 2025, and roughly 60% of stablecoin payment volume now comes from B2B transactions rather than trading (Source: Stablecoin Insider).

$1T

Circulation Projected by end of 2026

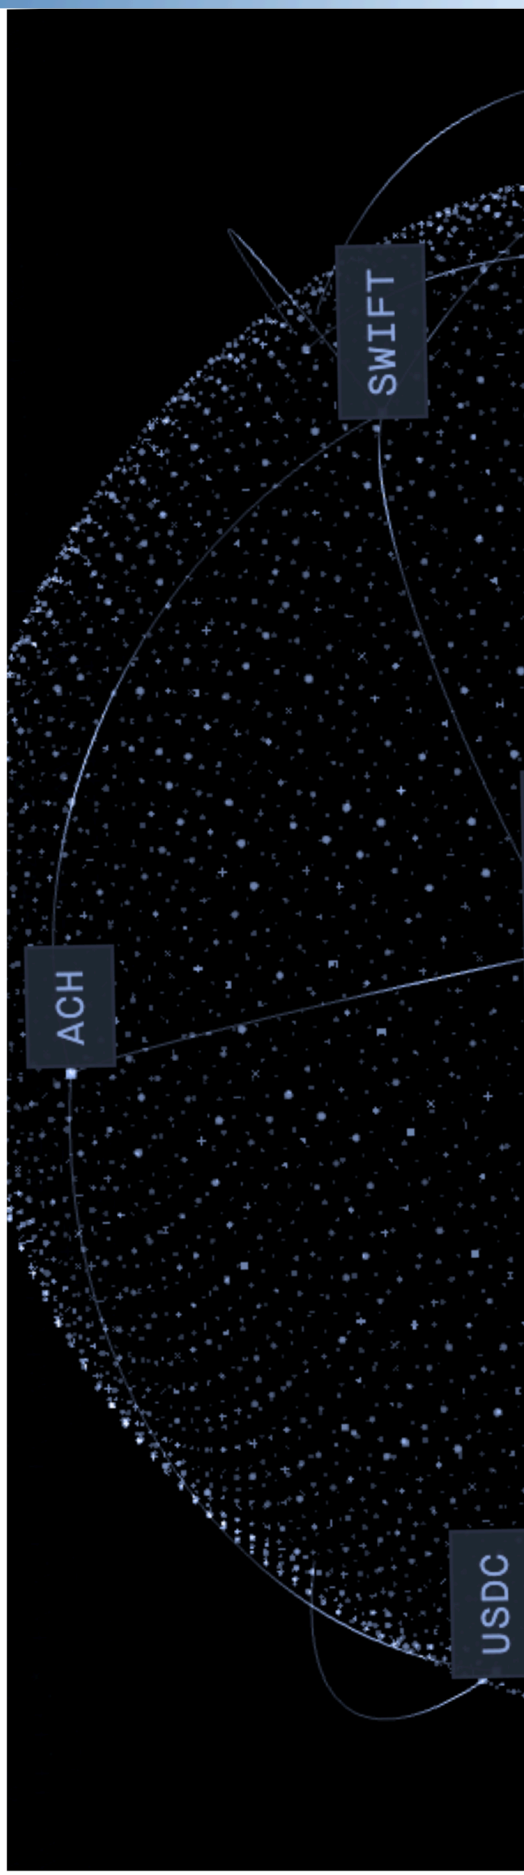
The maturation is not just about size. It is about structure. A recognizable value chain has formed, with distinct layers for issuance, treasury and banking infrastructure, payments, payroll, and yield.

This report maps that chain end to end and shows how two companies anchor its core layers:

- **Dakota**, the regulated infrastructure layer powering enterprise stablecoin operations, and
- **Rise**, the workforce payments layer that turns digital dollars into compensation for global teams.

The main **opportunity** in 2026 is operational rather than speculative. Companies that adopt stablecoin rails compress multi-day cross-border settlement to minutes, cut payment costs, and free trapped working capital.

The main **risks** are regulatory sequencing and reserve transparency, both of which are tightening under the US GENIUS Act and the EU's MiCA framework. What follows is a layer-by-layer guide to a stack that is becoming, in effect, a financial operating system.



Enjoy the reading.

1

The Stablecoin Economy Has Become Real Infrastructure

The Stablecoin Economy Has Become Real Infrastructure

The clearest sign that **stablecoins** have crossed from trading tool to infrastructure is that they now rival the established payment networks on raw throughput. **Annual stablecoin transfer volume grew from just $3.3 billion in 2018 to $18.4 trillion in 2024**, one of the fastest adoption curves in financial history (Source: Visual Capitalist). By 2025 that figure had climbed again.

A caveat matters here.

Total stablecoin transaction volume surpassed $28 trillion in Q1 2026 alone, but roughly 76% of that was bot-driven (Source: CEX.IO), so raw on-chain figures overstate real-economy use. The more telling metric is the share that reflects genuine commerce.

Platform data from Paybis shows stablecoins comprised 86% of aggregate crypto transaction volume in April 2026, up from 12% in July 2023 (Source: MoneyCheck), and the company recorded $2.81 billion in stablecoin processing during May 2026 with 135% year-over-year growth.

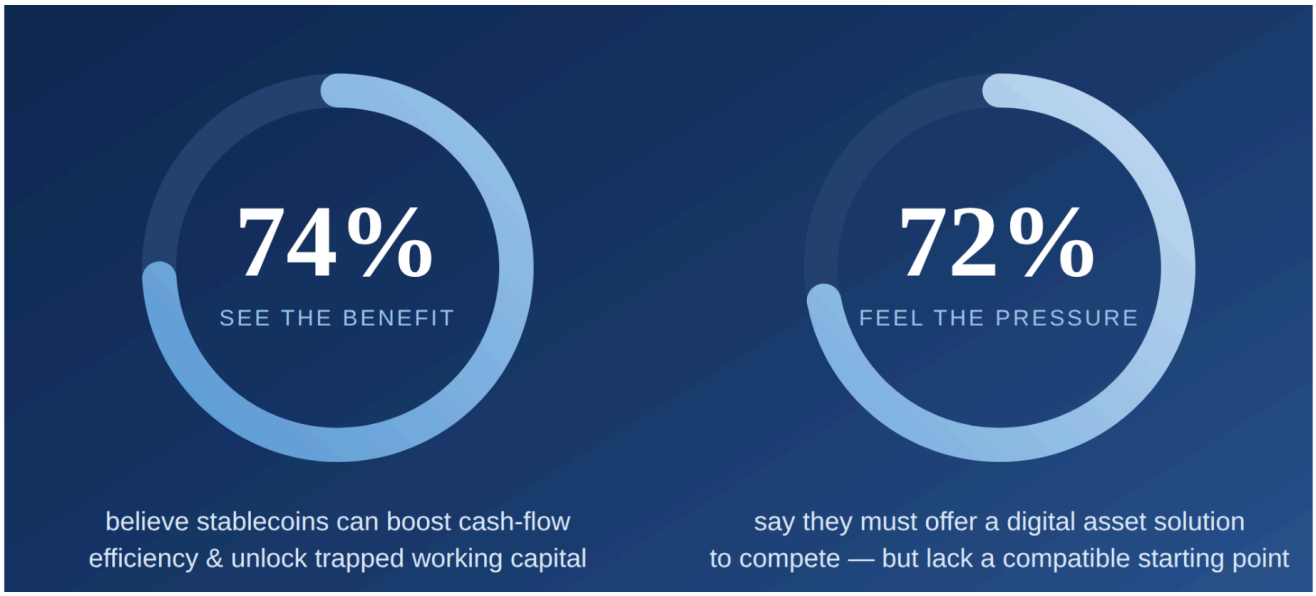
Supply tells the same institutional story.

Total stablecoin supply crossed $320 billion in early May 2026, with USDT holding roughly 58% market dominance and USDC near $78 billion (Source: KuCoin). Supply remains concentrated, with Ethereum and Tron together accounting for nearly 90% of it (Source: Stablecoin Insider), reinforcing their roles as the primary settlement layers for institutional and payment flows respectively.

“WHY ARE BUSINESSES INCREASINGLY HOLDING DIGITAL DOLLARS?”

Because the appetite has outrun the architecture.

Ripple's 2026 survey of more than 1,000 finance leaders found 74% believe stablecoins can boost cash-flow efficiency and u**nlock trapped working capital** (Source: Ripple), and 72% said they must offer a digital asset solution to stay competitive but lack a starting point compatible with existing workflows (Source: FinTech Weekly).



On the operational side, a Fireblocks survey of **295 institutions found 49% actively use stablecoins for payments, with another 41% piloting or planning** (Source: Dwellir).

The enterprises that established this layer early, Circle and Tether on issuance, Visa, Stripe, PayPal, and JPMorgan on the rails, built the on-ramps. The next layers are where the operating advantage now lives.

2

Understanding The Stablecoin Value Chain

Understanding The Stablecoin Value Chain

To make sense of where a company should participate, it helps to see **the chain as a sequence of layers**, each solving a distinct problem.

An issuer creates the digital dollar, a treasury and banking layer lets a business hold, move, and govern it, a payments layer executes transfers to suppliers and counterparties, a payroll layer routes value to a workforce, and a yield layer puts idle balances to work.

01 Issuance
An issuer creates the digital dollar.

02 Treasury & Banking
A business holds, moves, and governs it.

03 Payments
Transfers execute to suppliers and counterparties.

04 Payroll
Value routes to a workforce.

05 Yield
Idle balances are put to work.

Layer 1: Issuers

This is where **stablecoins are created and redeemed**. USDT holds roughly 60% of the market and USDC around 25% (Source: AirdropBee), with Sky's SUSD and Ethena's USDe rounding out a competitive top tier. Issuers handle reserves, attestation, and the mint-and-burn mechanics that keep a token pegged to a dollar.

Layer 2: Banking and treasury infrastructure

This is the layer that translates a raw token into something a business can actually operate with: **regulated custody, compliance, payouts, and cross-border movement**. It is also the layer most companies underestimate, because building it in-house means reconstructing custody, KYB, AML, transaction monitoring, and multi-rail settlement for every market entered.

This is Dakota's position in the chain.

Dakota is the regulated, AI-native platform for enterprise stablecoin infrastructure, the foundation that abstracts away that complexity so application-layer partners like Rise can build on top of it.

Four characteristics define the role.

Compliance is treated as the product rather than a cost. Dakota is a registered US Money Services Business with active state Money Transmitter Licenses, pursuing EMI and CASP licenses in Europe, and compliance is built into every API call through programmatic KYB, AML, transaction monitoring, and risk controls, an approach the company calls "compliance-as-code" that lets most customers onboard in under 24 hours.

It is global from day one. Supporting more than 100 jurisdictions, multiple rails, and stablecoin use cases from cross-border payouts to FX without fragmented vendor integrations.

Dakota is built from operating rather than theorizing, reflecting more than $6B+ in total transaction volume to date.

The rise of agentic payments. Building for agents, not just people.

Dakota is AI-native by design, so the same regulated APIs that let humans move money let autonomous agents do it too, with compliance, risk controls, and authorization embedded in every call. New agentic finance primitives shipping this quarter let teams build agents that transact directly on Dakota rails.

As Dakota founder and CEO Ryan Bozarth frames the thesis:

"Stablecoins won't reach their potential through better wallets. They'll reach it through better infrastructure.

The companies actually moving money at scale don't want to rebuild custody, compliance, and cross-border rails for every market they enter. They want regulated primitives they can compose.

That's what Dakota allows everyone to build."

RYAN BOZARTH,
FOUNDER & CEO - DAKOTA

3

Treasury Transformation

Treasury Transformation

The corporate treasury function is being rethought because the old model leaks money at the seams.

Global operations mean fragmented cash sitting in dozens of bank accounts across currencies and time zones. Settlement windows of three to five days lock up working capital, and cross-border intercompany transfers carry days of FX exposure just to move money between a company's own entities (Source: Ripple).

Capital efficiency suffers in proportion to how international a business becomes.

Stablecoin treasury attacks each of these. Holding balances in digital dollars consolidates fragmented cash into a single programmable position. Transfers between entities and geographies happen on demand rather than within banking windows. Stablecoin rails compress correspondent banking's two-to-five-day settlement to minutes and run 24/7 (Source: Stablecoin Insider).

The result is that stablecoins have become a treasury line item sitting alongside cash, money-market funds, and FX, and the decision of which infrastructure holds and governs that money is now made at board level.

"HOW DOES STABLECOIN TREASURY WORK IN PRACTICE ON A REGULATED FOUNDATION?"

Dakota provides the holding layer (regulated custody), the movement layer (global transfers and FX across 100+ jurisdictions), the consolidation layer (treasury operations that replace fragmented vendor stacks), and around-the-clock settlement, all through composable APIs, available via agentic SDKs.

The compliance-as-code architecture means a treasury team is not choosing between speed and regulatory safety.

As ***Bozarth*** puts it:

"For years, the choice in regulated money movement was either fast or compliant. We rebuilt that stack so it's both. Our customers onboard in under 24 hours and ship in markets where most teams would still be filing applications.

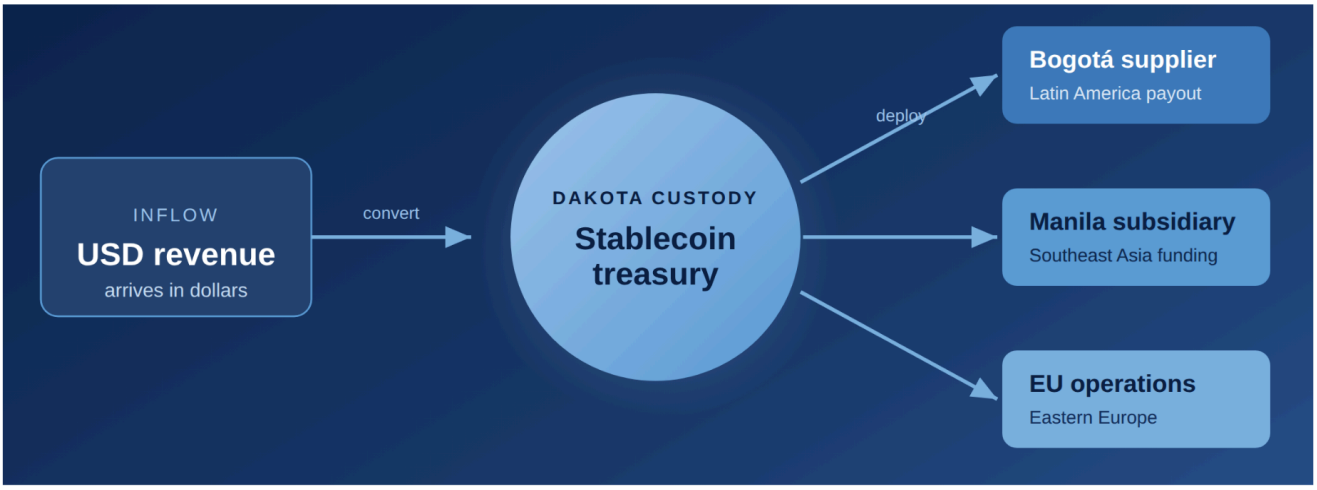
Compliance shouldn't be a wall in front of innovation: itshould be the foundation underneath it."

Illustrative Case

Consider a software company headquartered in the US with revenue arriving in dollars and operations spanning Latin America, Southeast Asia, and Eastern Europe.

Today it receives USD revenue, converts a portion to stablecoins, holds and consolidates that treasury through Dakota's regulated custody, and deploys funds globally, paying a Bogotá supplier or funding a Manila subsidiary, without waiting on correspondent banks or maintaining a local account in every market.

The same dollar that used to sit idle across fragmented accounts becomes a single, mobile, programmable balance.



(This example is composite and illustrative, not a named customer.)

4

Global Payments on Stablecoin Rails

Global Payments on Stablecoin Rails

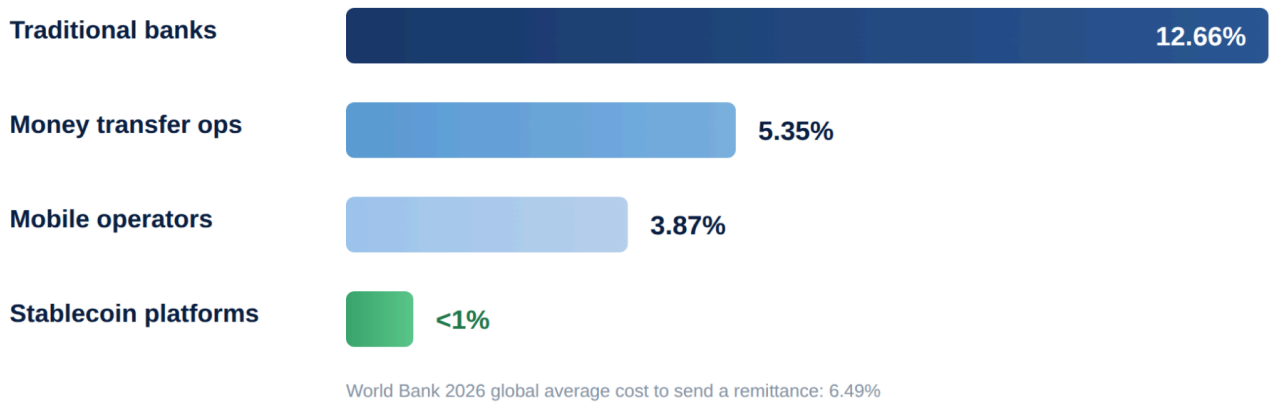
Once a business holds and governs stablecoins, the next layer is execution: paying suppliers, settling with merchants, and moving money internationally. This is where the cost and speed advantages become impossible to ignore, because the legacy system is genuinely expensive.

A World Bank survey of money transfer operators in 2026 shows sending international remittances costs an average of 6.49% of the amount (Source: OpenDue).

For a $200 cross-border transfer, traditional banks charge roughly 12.66%, money transfer operators around 5.35%, and mobile operators about 3.87%, while stablecoin platforms can bring the same transfer below 1% (Source: Keyrock via MEXC).

Speed compounds the savings.

A traditional remittance from Lagos to Nairobi takes three to five business days and costs the sender 6 to 8 percent, while a stablecoin remittance on the same corridor completes in roughly 60 seconds and costs 1.5 to 2.5 percent all-in (Source: Web3 Enabler).



LAGOS → NAIROBI

~60 sec

vs. 3–5 business days

1.5–2.5% all-in vs. 6–8%

BVNK · 4,600 USERS, 15 COUNTRIES

40% less

average cost vs. traditional remittance channels

B2B PAYMENTS · 30 MONTHS

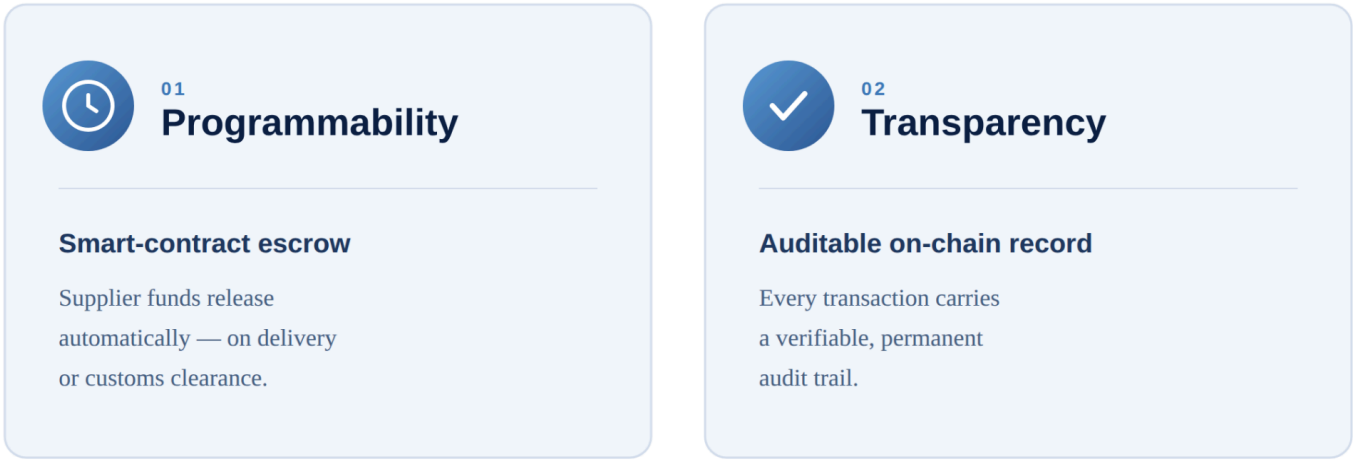
60×

<$100M → >$6B per month

71% of LATAM firms now use them

The **savings** are now well-documented at scale: BVNK's 2026 Stablecoin Utility Report, surveying 4,600 users across 15 countries, found stablecoin transfers cost an average 40% less than traditional remittance channels (Source: Polygon).

The shift is showing up in B2B flows specifically. **Stablecoin B2B payments surged from under $100 million per month in early 2023 to over $6 billion per month by mid-2025, a 60-fold increase in 30 months**, and 71% of Latin American firms already use stablecoins for cross-border payments (Source: Tazapay).



The benefits beyond cost are programmability and transparency: smart-contract escrow can release supplier funds automatically on delivery or customs clearance, and every transaction carries an auditable on-chain record. This is the natural extension of the treasury layer.

The same Dakota infrastructure that holds and governs balances connects directly to payment execution, so moving from "we hold stablecoins" to "we pay our counterparties in stablecoins" is a configuration change, not a new integration.

And because those APIs are composable, the same regulated calls that let a finance team move money let the agents that team builds move it too, with compliance and authorization enforced on every payout.

5

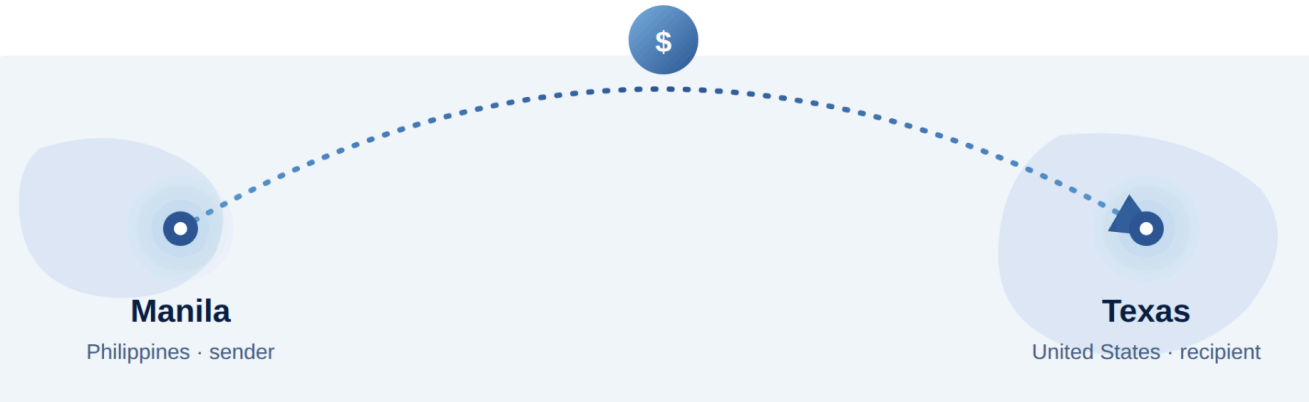
Stablecoins Move Beyond Payments Into Payroll

Stablecoins Move Beyond Payments Into Payroll

Paying suppliers is one thing, paying people is harder, and it is where the next layer of the chain lives.

The structural drivers are demographic and economic. The global workforce is increasingly distributed, the contractor economy has expanded across borders, and talent mobility means a company headquartered in one country routinely employs people in dozens of others. Traditional payroll was never built for this.

The friction points are familiar to anyone who has run international payroll. Banking limitations mean some workers in emerging markets have unreliable or no access to the correspondent banking system.



Five years ago, paying a contractor in Manila from a company in Texas meant a wire that took three to five business days, passed through multiple correspondent banks, and arrived lighter by 6% or more in fees (Source: Financial Content).

FX markups

Erode the value of every payout.

Settlement delays

Leave workers waiting on funds.

Compliance

Multiplies with every new jurisdiction.

The Two Benefits beyond costs:

01
Programmability

Smart-contract escrow

Supplier funds release automatically — on delivery or customs clearance.

02
Transparency

Auditable on-chain record

Every transaction carries a verifiable, permanent audit trail.

Workers themselves have driven adoption from the bottom up, for reasons that are economic rather than ideological.

More than 25% of global freelancers opted for partial crypto payments by 2024, with workers in Argentina, Nigeria, and Southeast Asia leading; an Argentine developer watching 124% annual inflation did not need a whitepaper to understand why receiving USDC made more sense than pesos (Source: Stablecoin Insider).

When a worker's home currency is volatile and their bank takes 6% on every inbound transfer, a stable digital dollar that arrives in seconds is not a novelty. It is a raise.

This is the demand that the payroll layer of the value chain exists to serve.

6

The Rise of Stablecoin Payroll

The Rise of Stablecoin Payroll

This is where Rise becomes the primary featured partner in the chain. **Modern payroll infrastructure has to do something the legacy model never attempted**: let an employer run one unified process while every worker chooses how they get paid.

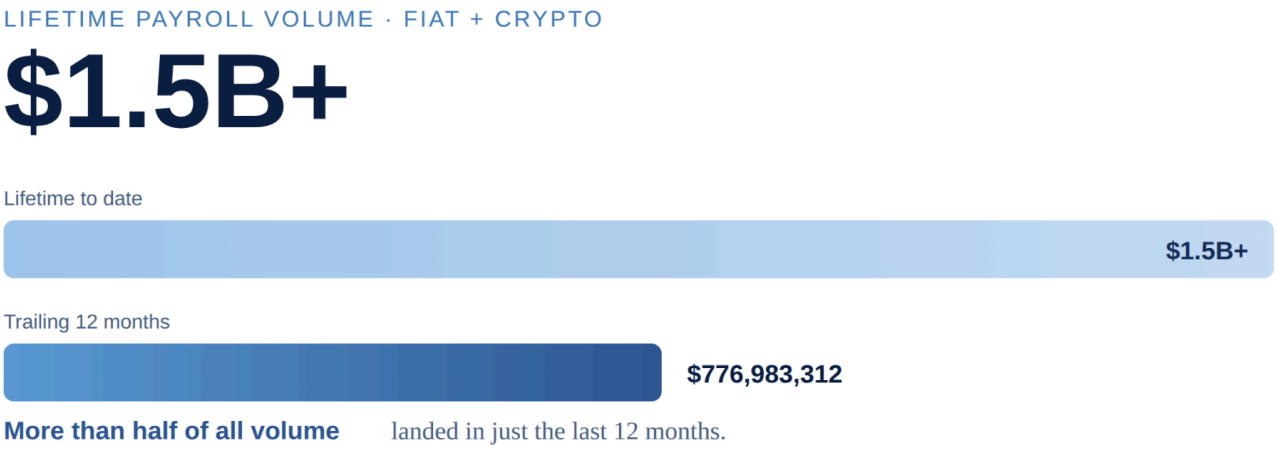
Rise covers the full surface of global workforce payments:

The mechanics are what make it work at scale. Companies fund payroll in USD or stablecoins, and workers choose their own withdrawal method every cycle from 90+ fiat currencies, USDC, USDT, or 100+ other crypto assets, while the employer runs one process regardless of individual preferences (Source: Financial Content).

Settlement is fast and multi-chain: payouts settle in 15 to 90 seconds across Arbitrum, Ethereum, Polygon, Optimism, and Avalanche, and the platform now covers 190+ countries with EOR coverage expanding toward 60+ markets by the end of 2026 (Source: Financial Content).

The compliance backbone, SOC 2 certification, GDPR compliance, FinCEN registration, and an official Circle/USDC partnership, is what lets enterprise finance teams adopt it without a separate risk project.

The data bears that out. Rise has processed $1.5 billion+ in lifetime payroll volume across fiat and crypto rails, with $776,983,312 of that, more than half, occurring in the trailing 12 months (Source: Rise). That concentration confirms adoption is accelerating through active production use.



The most striking behavioral signal in the Q1 2026 report is that stablecoin withdrawals now exceed stablecoin deposits by $154.5 million on the platform, and USDT leads worker-side stablecoin withdrawals in major non-US markets (Source: Stablecoin Insider).

Workers are not just receiving stablecoins:
they are choosing to keep them.

An architectural distinction matters at this layer. Some large HR platforms have added stablecoin payroll recently through third-party vendors.

Deel, for example, partnered with MoonPay in February 2026 to enable stablecoin salary payouts, initially rolling out to UK and EU workers from March 2026 with US availability later (Source: Bitget). Rise's stablecoin payroll, by contrast, is built natively and has run in production since 2022, which removes the extra fees, conversion steps, and compliance handoffs that come with outsourced rails.

For a finance team evaluating the payroll layer, native infrastructure is the difference between a feature and a foundation.

"Stablecoin payroll only matters if it's invisible to the employer and empowering for the worker.

We built Rise so a company runs one process while every worker picks how they get paid, and increasingly they're picking stablecoins."

HUGO FINKELSTEIN,
CEO - RISE

7

Stablecoin Yield Becomes A Treasury Strategy

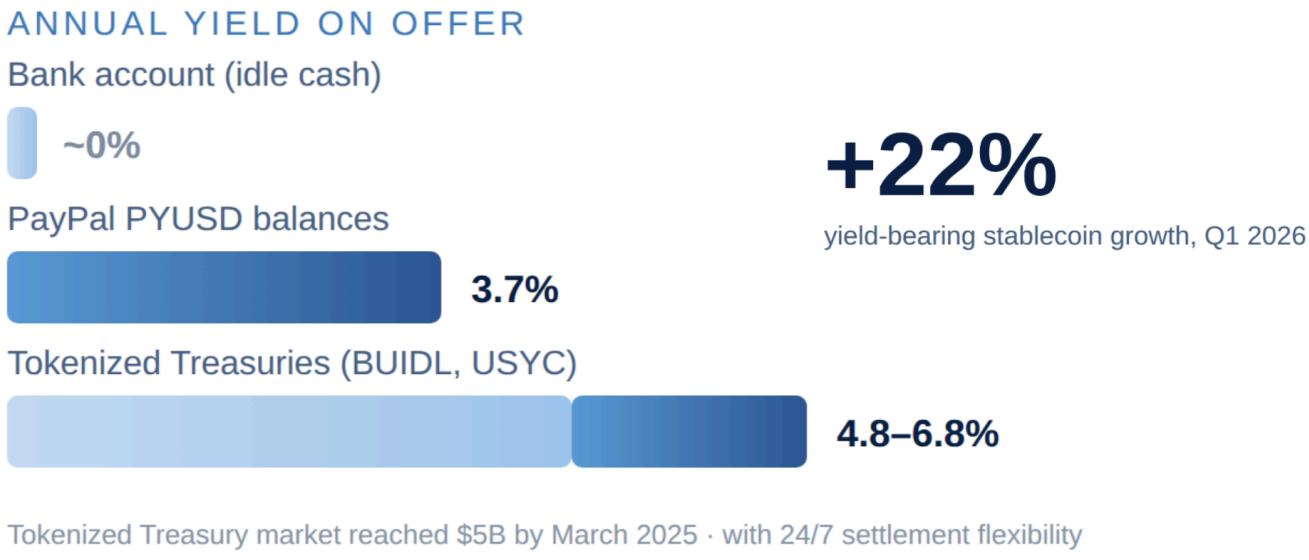
Stablecoin Yield Becomes A Treasury Strategy

Once a company holds stablecoins, an obvious question follows: what should idle balances be doing?

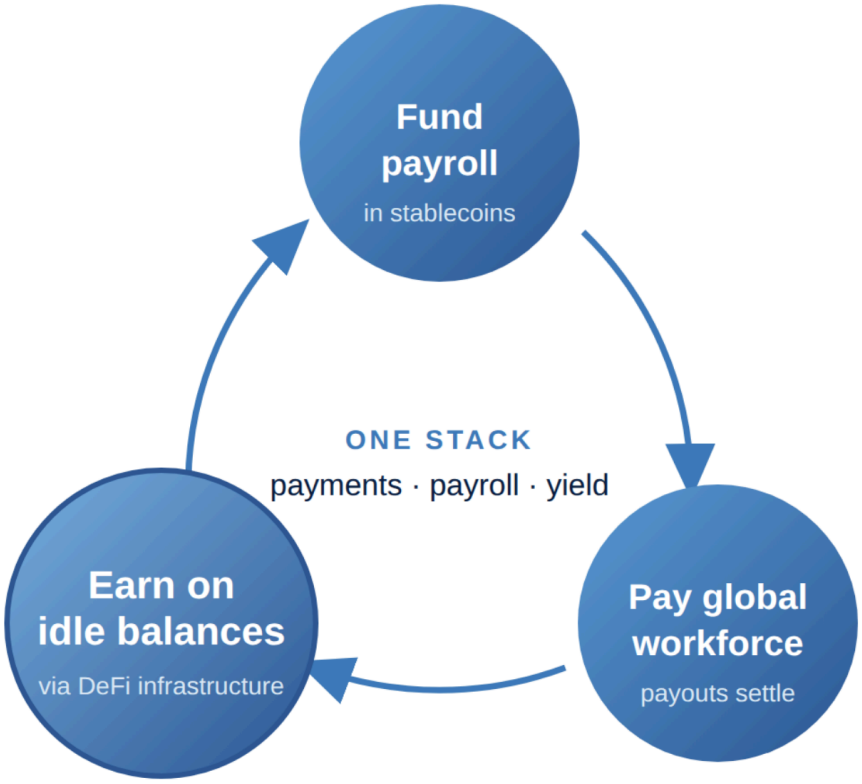
In the traditional model, cash sitting in operating accounts earns close to nothing. On-chain, the same balance can earn a yield while remaining liquid, which turns treasury from a cost center into a contributor.

The economics are compelling enough that issuers and asset managers are competing for those balances. The tokenized Treasury market reached $5 billion by March 2025, offering yields of 4.8% to 6.8% through instruments like BlackRock's BUIDL and Circle's USYC, while PayPal now offers 3.7% yield on PYUSD balances as a direct bid for enterprise treasury deposits (Source: Dwellir).

Corporate idle cash that earns near-zero in a bank account can instead earn a meaningful return with 24/7 settlement flexibility.
The growth in yield-bearing products is now a primary driver of the whole market: yield-bearing stablecoins grew over 22% in Q1 2026 and contributed more than half of the net increase in stablecoin market cap (Source: CEX.IO).



This is the layer **Rise Earn** occupies. Rather than letting stablecoin balances sit idle between payroll cycles or after withdrawal, Rise Earn lets users put those balances to work, generating yield on stablecoins held on the platform through established DeFi infrastructure.



For a company already funding payroll in stablecoins through Rise, the yield layer is adjacent rather than separate:

the same balances that pay a global workforce can earn between cycles, and workers who choose to hold their stablecoin earnings can do the same. It closes the loop on capital efficiency, the idle-balance problem that every treasury team eventually confronts, answered inside the same stack that handles payments and payroll.

8

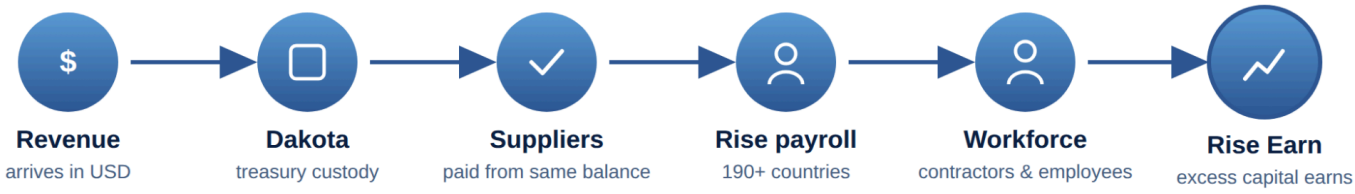
The Full Stablecoin Operating System

The Full Stablecoin Operating System

Each layer is useful on its own. Together they form something larger: a financial operating system where revenue enters, is held and governed, flows out to suppliers and workers, and earns on the way through, all on a single set of regulated rails.

Dakota and Rise compose into one continuous money flow rather than a collection of point solutions.

Picture a global company running the full stack. It receives revenue, converts funds to stablecoins, stores and consolidates that treasury with Dakota, sends supplier payments out of the same balance, pays contractors and employees through Rise across 190+ countries, and deploys excess capital into Rise Earn.



What makes this an operating system rather than a toolkit is that value never has to leave the rails.

In the legacy world, each of these steps means a different vendor, a different settlement window, a different reconciliation process, and an FX conversion at every boundary.

On stablecoin rails, the dollar that arrives as revenue is the same programmable unit that pays a supplier in Bogotá, a contractor in Manila, and an employee in Lisbon, and then earns yield in the gaps.

The view that this is becoming core infrastructure is now shared across the industry, with corporations, banks, and AI agents turning on-chain dollars into payment rails (Source: crypto.news).

That last group is where Dakota's design choice pays off: the platform is AI-native, so the same regulated APIs that let a finance team move money let the agents it builds do it too, with compliance and authorization embedded in every call.

Dakota supplies the regulated foundation for the top half of that flow; Rise supplies the workforce-facing execution and yield for the bottom half.

Composed, they describe how a global business will actually run treasury, payments, payroll, and capital efficiency on one continuous layer.

9

Regulation, Compliance, and Enterprise Adoption

Regulation, Compliance, and Enterprise Adoption

None of this scales without regulatory clarity, and 2026 is the year the major frameworks moved from proposal to enforcement.

In the United States, the GENIUS Act is the anchor. Enacted in July 2025, it directs the OCC, FDIC, Federal Reserve, NCUA, and Treasury to issue implementing rules, most of them due by July 18, 2026, with the Act taking effect on the earlier of January 18, 2027, or 120 days after final rules (Source: Sullivan & Cromwell).

The rulemaking is well underway:

- The OCC issued its notice of proposed rulemaking on February 25, 2026 (Source: OCC).
- The FDIC followed on April 7, 2026 (Source: Sullivan & Cromwell).
- Treasury's FinCEN and OFAC issued a joint proposed rule to implement the Act's illicit-finance provisions (Source: U.S. Treasury).

The core requirements, 1:1 reserves in dollars or liquid equivalents, regular audits for large issuers, and a prohibition on issuer-paid yield, give enterprises the predictability they have been waiting for.
In Europe, MiCA is moving to full enforcement.

The transitional period for crypto-asset service providers expires across most member states by July 1, 2026, after which unauthorized providers must wind down (Source: Sumsub).

Stablecoin rules under MiCA's e-money and asset-referenced token regime have applied since mid-2024, with strict reserve composition requirements, at least 60% of reserves held as bank deposits for significant tokens (Source: Eco).

Beyond the headline frameworks, enterprise adoption depends on the **Travel Rule, strict AML/KYC, and treasury controls** being handled as infrastructure rather than afterthoughts.

This is precisely where the application layers differentiate themselves. Dakota's positioning is compliance-first treasury operations, with its MSB registration, state Money Transmitter Licenses, and compliance-as-code architecture embedding KYB, AML, and transaction monitoring into every API call, and EMI and CASP licenses in active pursuit in Europe.

Because that compliance is embedded at the level of the API call rather than the user session, it holds whether a person or an autonomous agent initiates the transaction, which is what makes Dakota's rails safe for agent-initiated money movement as that frontier opens.

Rise's positioning is compliance-first payroll infrastructure, with SOC 2 certification, GDPR compliance, FinCEN registration, and a Circle partnership that aligns it with the regulated USDC issuer.

In a market where no single federal stablecoin statute had taken full effect as of early 2026 and rules were still being finalized (Source: Spark), **the partners that treated compliance as the product are the ones enterprises can adopt today**.

10

Predictions For The Stablecoin Value Chain (2027–2030)

Predictions For The Stablecoin Value Chain

The trajectory through the end of the decade is becoming legible. **Seven predictions follow from where the data points in 2026.**

>$1T

SUPPLY · LATE 2026

Supply crosses the trillion mark

Treasury, payments and payroll demand make $1 trillion a floor — not a ceiling.

$4.6B

VISA SETTLEMENT · ANNUALIZED

Treasury goes on-chain by default

Visa already settles billions; banks ship programmable treasury. Early-adopter → standard.

HYBRID

PAYROLL · BY DEFAULT

Payroll splits fiat and crypto

Given the choice, workers pick stablecoins — and employers who offer it win on retention.

YIELD

BUILT-IN · NOT BOLTED ON

Yield bakes into the workflow

Idle balances earning a return become the expectation, not a separate decision.

MERGE

DEPOSITS + STABLECOINS

Bank balances blur with stablecoins

Banks issue regulated tokens beside USDC and USDT — the line all but disappears.

$719T

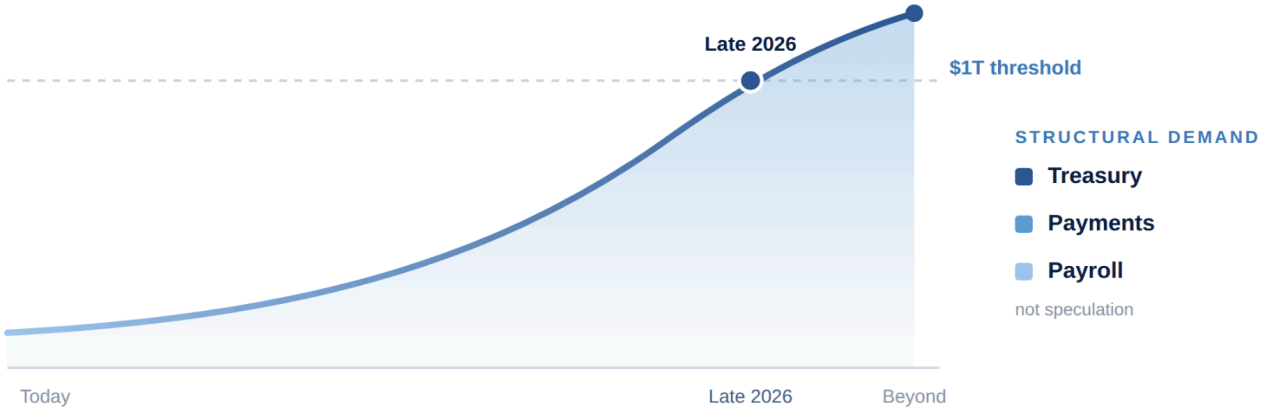
ADJ. VOLUME · BY 2035

CFOs get real-time treasury visibility

On pace to match Visa + Mastercard's off-chain volumes between 2031 and 2039.

1. Supply crosses the trillion-dollar mark and keeps going

Circulation is projected to exceed $1 trillion by late 2026 (Source: Stablecoin Insider), and the structural demand behind that number, treasury, payments, and payroll rather than speculation, suggests it is a floor rather than a ceiling.



2. Treasury management moves on-chain by default

With Visa reporting annualized stablecoin settlement volume of $4.6 billion on its network in its Q1 2026 earnings call (Source: Bessemer) and major banks launching programmable treasury products, holding and moving corporate cash on-chain shifts from early-adopter behavior to standard practice.

3. Payroll becomes hybrid by default

The Rise data showing withdrawals outpacing deposits indicates that once workers can choose, many choose stablecoins, and employers who offer the choice gain a recruiting and retention edge.

4. Yield integrates directly into financial workflows

Idle balances earning a return become the expectation rather than a separate decision, exactly the loop Rise Earn closes.

5. Tokenized deposits and stablecoins converge

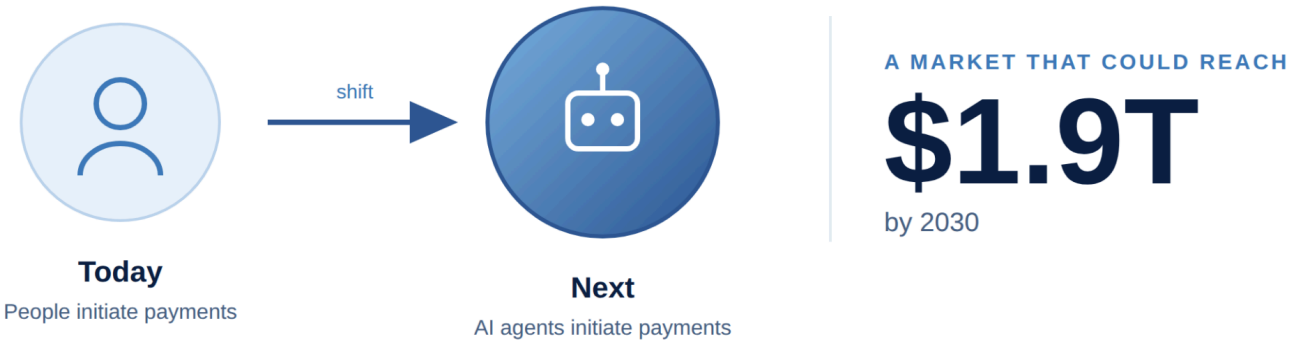
As banks issue their own regulated tokens alongside USDC and USDT, blurring the line between a bank balance and a stablecoin.

6. CFOs gain real-time treasury visibility

With adjusted stablecoin volume projected to reach $719 trillion by 2035 through organic growth alone, and stablecoin payment volumes on pace to match Visa and Mastercard's off-chain volumes between 2031 and 2039 (Source: Chainalysis).

7. AI agents become transaction initiators.

The next initiators of stablecoin payments won't all be people. AI agents are expected to become primary initiators of stablecoin transactions, supporting a market that could reach $1.9 trillion by 2030 (Source: crypto.news), a use case with no traditional-finance equivalent.



It only works on rails where compliance and authorization are embedded in every call, which is why Dakota is building agentic finance primitives that let autonomous agents transact directly on regulated infrastructure.

Conclusion: The Stablecoin Stack Is Becoming a Financial Operating System

The Stablecoin Stack Is Becoming a Financial Operating System

The defining shift of 2026 is that the industry has stopped asking whether stablecoins work.

With transaction volumes past $33 trillion annually and market capitalization above $312 billion, the question for finance teams is no longer whether to adopt stablecoin rails but which layer to run them on (Source: Bitget).

The value chain has matured into something that resembles a financial operating system, and the practical decision in front of every global company is where to participate in it.

The blueprint is clear:

- **Dakota** powers the regulated treasury and capital-movement foundation.
- **Rise** powers workforce payments and payroll execution across 190+ countries.
- **Rise Earn** powers capital efficiency on idle balances.

Together they describe how businesses will actually use stablecoins over the coming decade: not as a speculative bet, but as the rails that move revenue in, pay suppliers and people out, and earn on the way through.

THE COMPANIES THAT MAP THEIR OWN OPERATIONS ONTO THIS STACK NOW, CHOOSING REGULATED, NATIVE INFRASTRUCTURE AT EACH LAYER, **ARE THE ONES THAT WILL COMPOUND THE ADVANTAGE AS THE REST OF THE MARKET CATCHES UP.**

Our Partners

Our Partners

DAKOTA
Dakota provides regulated stablecoin infrastructure for institutional money movement, offering a unified platform for stablecoin orchestration, custody, and compliance.

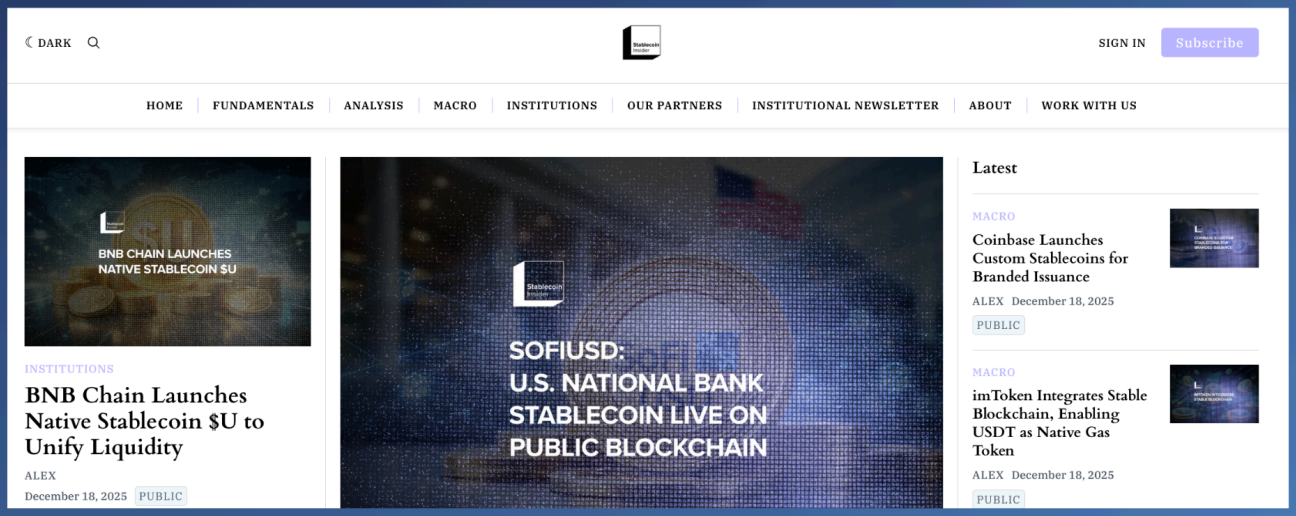
RISE
Rise is a global payroll and compliance platform built for companies hiring and paying distributed teams across borders. Rise consolidates every step such as onboarding, compliance, payments, and reporting into a single platform.

About Stablecoin Insider

Stablecoin Insider is the leading online journal that focuses solely on stablecoins, covering the instiutions, protocols, policies, platforms, and players shaping the future of digital money.

Our focus moves away from the hype-driven meme coin and investment narratives, centering instead on crypto's role as a stable and practical payment solution.

We want to be the go-to knowledge hub for professionals in the stablecoin space through reports, interviews, research collaborations, and events.



We believe stablecoins are becoming the foundation of crypto's next era, and we're here to cover their evolution at every step.

Methodology

This report synthesizes publicly available 2026 data from industry research firms, regulatory filings, and primary company disclosures, all cited inline.

Market-level figures (supply, transaction volume, adoption surveys) are drawn from sources including Chainalysis, Fireblocks, BVNK, Ripple, The World Bank. Regulatory timelines reflect official US Treasury, OCC, and FDIC rulemaking and EU MiCA guidance current as of mid-2026. Where on-chain transaction volume is cited, readers should note that raw figures include automated and bot-driven activity; adjusted or B2B-specific figures are used where available to reflect real-economy use.

Rise platform metrics (payroll volume, withdrawal behavior, corridor data) come from Rise's published Q1 2026 Stablecoin Payroll Report. Dakota figures are provided by Dakota. Forward-looking projections are attributed to their originating source and represent scenarios, not guarantees.

DISCLAIMER

This report has been prepared by Stablecoin Insider for informational and educational purposes only and does not constitute financial, investment, legal, tax, accounting, or other professional advice. Nothing in this report should be construed as a recommendation, solicitation, or offer to buy or sell any asset, token, security, or financial product, or to engage in any particular strategy or transaction. Readers should obtain independent advice from qualified professionals before making decisions based on the information contained herein.

Stablecoins, digital assets, and related technologies involve significant risks, including but not limited to loss of principal, depegging, liquidity constraints, smart contract vulnerabilities, custody and counterparty risk, operational failures, market volatility, and regulatory or legal changes that may occur rapidly and without notice. Past performance is not indicative of future results, and any examples, case studies, or references are provided for context only.

While reasonable efforts have been made to ensure the accuracy of the information as of the publication date, Stablecoin Insider makes no representation or warranty, express or implied, as to the completeness, reliability, timeliness, or accuracy of the content.

Information may be derived from public sources and third parties believed to be reliable; however, such information has not necessarily been independently verified. Opinions, estimates, and forward-looking statements reflect the judgment of the authors at the time of writing and are subject to change without notice.

Where information is based on materials supplied by participating companies, Stablecoin Insider may not have independently verified all claims. Readers should conduct their own independent diligence and seek professional advice before making decisions based on this report. References to specific companies, protocols, networks, issuers, service providers, or products are not endorsements and should not be interpreted as such. Any trademarks or product names are the property of their respective owners.

To the maximum extent permitted by law, Stablecoin Insider disclaims any liability for any losses or damages arising from reliance on this report or its contents. Use of this report is at the reader’s own risk.
