Executive Summary

Stablecoins are evolving beyond the hype around crypto as a speculative investment to increasingly play a crucial role as a transactional utility.[1] Forrester research shows how financial institutions are applying stablecoins to solve real-world problems — from cross-border payouts to treasury management — to reduce transaction costs, friction, and wait times.[2] Stablecoins are already enabling the next-generation of payments and banking.

While value of stablecoins is increasingly clear, many financial providers remain cautious about how and when to act. Regulatory and technical uncertainty is breeding fear. But providers seeking efficiencies and competitive advantages can't afford to stay on the sidelines. Effective stablecoin adoption doesn't require a regulatory crystal ball, only organizational buy-in and a willingness to build and scale from a set of use cases.

Successful financial institutions will grasp the stablecoin market shift, identify concrete use cases tied to measurable value, align stablecoin efforts with AI roadmaps, and leverage strategic partners to drive innovation.

In March 2026, AWS Marketplace commissioned Forrester Consulting to evaluate the state of financial organizations, including specific stablecoin and AI capabilities. Forrester conducted customer interviews and an online survey with 521 global technology and business strategy decision-makers at the manager level and above to explore this topic.

Key Findings

Stablecoins are not a standalone product but a value-add utility. Leading financial providers view stablecoins less as a crypto product and more as a tool that enables a range of capabilities. This comes as two-thirds of financial decision-makers prioritize alternative money transfer and payment mechanisms in 2026.

AI has gained industry traction, amplifying stablecoin value. AI initiatives are maturing as financial providers scale generative AI (genAI) efforts and launch new agentic capabilities. More than three in four respondents (78%) are prioritizing enhanced decision-making with AI-powered insights and predictions. AI is increasingly used in concert with stablecoins, enabling providers to turbocharge next-gen payments and banking.

Cross-border transactions are the flagship use case, but leading organizations envision more. Two-thirds of organizations say using stablecoin capabilities for cross-border payments offers clear, immediate benefits. A smaller share of financial providers see value in applying stablecoins to use cases like intrabank transactions, cash management, and institutional settlements. Benefits include shorter settlement times, reduced transaction costs, and improved liquidity.

Providers are turning to partners to make the most of the stablecoin opportunity. Three in five respondents place a high priority on using third-party platforms or marketplaces to integrate their financial services so they can successfully compete. Providers will need scalable infrastructure to enable stablecoin success. They'll also need help resolving security and regulatory concerns, some of which can only be settled by government agencies.

Stablecoins Are Becoming An Operational Reality For Financial Providers

Thanks in part to stablecoins, blockchain technology is back in the limelight — now as less of an overhyped fad and more as a value-adding utility for key use cases.[3] Stablecoins — digital assets pegged to a fiat currency — can improve speed, cost, transparency, efficiency, and liquidity.[4]

Stablecoins are not the only priority: Financial institutions (FIs) are dealing with regulatory and market pressures as they look to grow and scale (see Figure 1). Security remains a top focus: 67% of survey respondents call improving their security and risk efforts paramount. And organizational resiliency has become critical amid geopolitical tensions and data vulnerability. The head of strategy in UK banking said: "Banks [are] more resilient than before, but they're not immune. Geopolitics doesn't stop transformation. It just reshapes the priorities." AI has also rocketed to the top of financial services executives' minds and roadmaps as both an opportunity and potentially an existential threat.

> "What's changed over the last few years is that resilience is now built into the operating models. There are capital buffers. There is stress testing. There are operational resilience frameworks, which are far stronger than the financial crisis that took place in 2007–2008, or even pre-COVID."
>

FIGURE 1

Top Strategic Goals Over The Next 12 Months

Note: Showing top four responses
Base: 521 global financial services decision-makers with responsibility for their organization's technology strategy
Source: A commissioned study conducted by Forrester Consulting on behalf of AWS Marketplace, April 2026

But stablecoin is a focus for a growing set of providers: 70% of professionals at FIs say stablecoins are a priority for their organization. A key goal for these respondents is facilitating cross border transactions (71%) and adopting alternative money transfer and payment mechanisms (67%). Two in three decision-makers (65%) added that stablecoin offerings will soon become table stakes for financial providers. This aligns with Forrester's research, which underscores the growing importance of stablecoins in B2B settings — for example, with highly practical cross-border payments.[5]

Importantly, stablecoins are designed for the challenges and growing risk persistent in today's global environment. The difference between stablecoins and previous crypto buzz is that many FIs are now building *with* regulators instead of around

65%

of decision-makers said that stablecoin offerings will soon become table stakes for financial providers.

them.[6] The chief strategy officer at a UK fintech and technology platform said: "There's an underlying value proposition to just the simplicity of a stablecoin on blockchain. Some of it is time, some of it is cost, and some of it is complexity."

> "Risk functions are no longer the gateways. They are becoming co-designers of innovation. Innovation is no longer happening in isolation."
>
> **HEAD OF STRATEGY, BANKING, UK**

CROSS-BORDER TRANSACTIONS OFFER A CLEAR FLAGSHIP USE CASE

As organizations experiment with early stablecoin adoption, they're finding wins with cross-border transactions — both with business and person-to-person payments — according to 67% of respondents (see Figure 2). The head of strategy at a UK bank said, "Global platforms are now in need of regional flexibility [that can] be built in."

More than half of respondents (56%) also use stablecoins for treasury and cash management. And stablecoin capabilities are evolving. The current efforts and proofs of concept will lead to an expanded set of use cases as stablecoin adoption matures and customers demand more convenient, real-time, and global capabilities. As one executive director of banking in the US said: "The bottom line is that stablecoin is the future of fast money if it is done diligently with the right set of regulations and the right set of rules."

> "[Stablecoins] are designed to move anywhere they want. It's perfectly designed for a world in which nations that control large money-center banks no longer can unilaterally decide to block payments."
>
> **CHIEF STRATEGY OFFICER, FINTECH AND TECHNOLOGY PLATFORM, UK**

FIGURE 2

Current Stablecoin Use Cases

Note: Showing top 10 responses
Base: 521 global financial services decision-makers with responsibility for their organization's technology strategy
Source: A commissioned study conducted by Forrester Consulting on behalf of AWS Marketplace, April 2026

FROM THE VOICE OF THE CUSTOMER

"When you think of 'next-generation payments and banking,' what comes to mind?"

"Payments are processed instantly, and cross-border payments without geographical restrictions do not rely on traditional bank accounts."

DIRECTOR, FINTECH AND TECHNOLOGY PLATFORM, CHINA

"Using blockchain technology to send money globally in seconds with minimal fees."

MANAGER, BANKING, UAE

STABLECOINS CONVERGE WITH AI ROADMAPS TO POWER NEXT-GENERATION INNOVATION

As stablecoins gain momentum, AI remains a top priority for financial institutions. Most organizations (52%) are now either scaling genAI or have operationalized genAI across their enterprise as pressure mounts to put AI into production (see Figure 3). Meanwhile, 78% of surveyed respondents prioritize enhanced decision-making with agentic-AI-powered insights and predictions.

The head of strategy at a UK bank noted genAI's cost-efficiency and speed: "GenAI is definitely delivering value today. Typically, any [genAI use case producing] between 12% and 22%

"Banks are ring-fencing innovation while they are industrializing the control. They are pushing ahead on AI and digital capabilities, but within a clear, defined risk and regulatory barriers."

HEAD OF STRATEGY, BANKING, UK

productivity uplift in targeted functions is funded and rolled out globally." Forrester research describes how financial institutions are deploying AI agents to transform back-office operations and automate manual tasks like data processing, reporting, and reconciliation.[7] The executive director at a US bank highlighted additional uses, such as:

> "Agentic AI is where banks see future transformation, but they are not letting it run ahead of their governance."
>
> **HEAD OF STRATEGY, BANKING, UK**

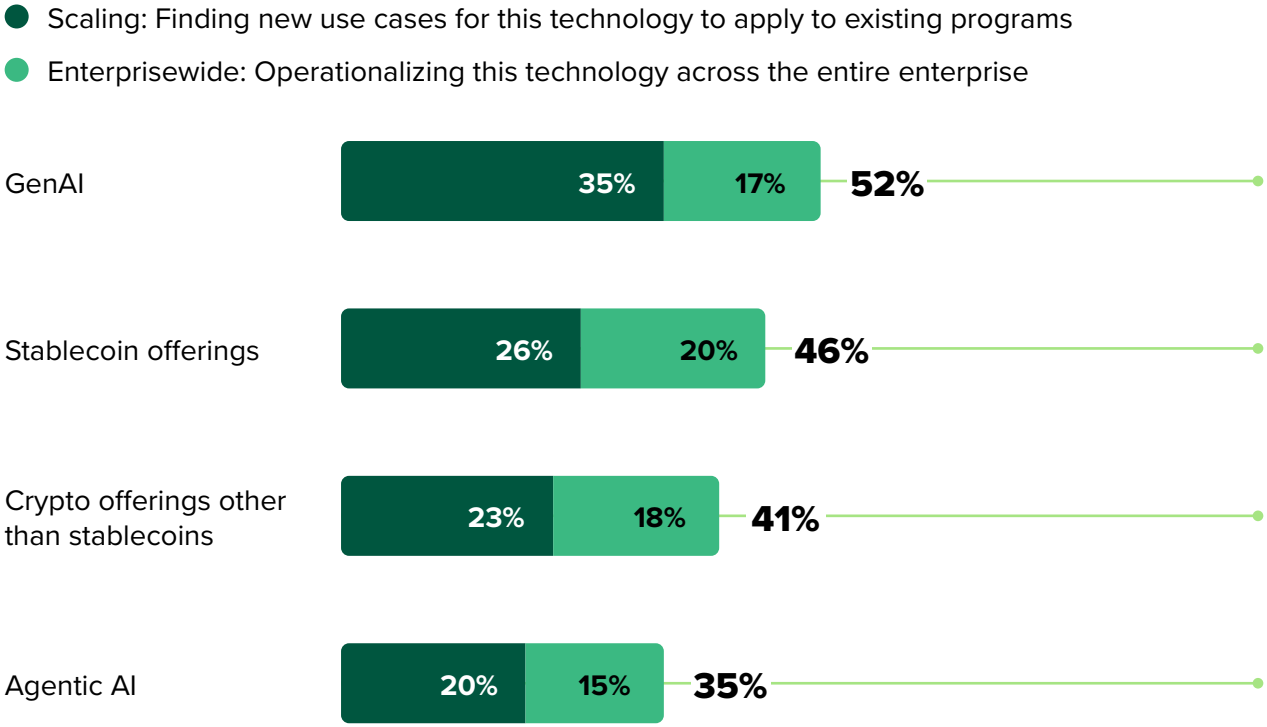

- Tailored and scalable customer recommendations, obviating the need for relationship managers.
- Chatbots with 360-degree customer views, which offer 24/7 query resolution and "self-heal" to reduce call center handling time and escalation.
- Code writing that accelerates security response and reduces costs and development cycles.

Organizations are increasingly reaping value from their investments into AI, but they still need to treat AI strategically — not just as a button to push. Rather than forge ahead with separate strategies, organizations are also generating greater payoffs from merging AI with stablecoin forces to maximize natural overlaps and supercharge payments and banking.

> "The one place where [AI is producing material value] is combining agentic AI with a stablecoin on blockchain tech and using that for a global payments system solution. That is a very powerful combination and one that [financial services] groups are investigating as we speak."
>
> **CHIEF STRATEGY OFFICER, FINTECH AND TECHNOLOGY PLATFORM, UK**

FIGURE 3

Adoption Stage By Technology

Note: Showing four responses
Base: 521 global financial services decision-makers with responsibility for their organization's technology strategy

Risk And Regulatory Friction Hinder Stablecoin Adoption

While stablecoins offer a viable — and transformative — alternative to financial transactions, many firms are slow to adopt. How come?

- **Regulatory winds impede buy-in.** More than two in three decision-makers (68%) said the lack of regulatory clarity hampers adoption (see Figure 4). The complexities of evolving regulation across jurisdictions fuel compliance concerns and greater uncertainty, steering many to pause and observe — for now.
- **Decision-makers perceive excessive risk.** According to 63% of respondents, privacy and security concerns, in part due to a lack of stablecoin education and real-world examples, deter them from adopting stablecoins with greater confidence. In this sense, it's not the underlying technology but a lack of exposure standing in the way.
- **Poor flexibility adds barriers to entry.** Forrester research states that operational complexity and outdated infrastructure obstructs stablecoin adoption.[8] Three in five surveyed respondents said their organizations struggle to integrate with existing systems and workflows. As the head of strategy at a UK bank explained, "The biggest challenge for these banks is legacy systems and the legacy integration."

FIGURE 4

Barriers To Successful Stablecoin Integration

Note: Showing top two responses
Base: 521 global financial services decision-makers with responsibility for their organization's technology strategy
Source: A commissioned study conducted by Forrester Consulting on behalf of AWS Marketplace, April 2026

As decision-makers wrestle with process hurdles and IT gaps, their ability to innovate (55%) and create better customer experiences (53%) suffers. Interviewees noted that while many organizations take a wait-and-see approach, others proactively seek innovation's bleeding edge — or follow right behind — ready to capitalize on quick wins and grow the business.

> "Most treasurers we speak to say, 'We still think [stablecoins are] just too risky — we don't really understand the benefit.' [This] is usually the line that we get."
>
> **CHIEF STRATEGY OFFICER, FINTECH AND TECHNOLOGY PLATFORM, UK**

Decisive Actors Will Reap The Benefits Of Stablecoins

Inaction and neutrality are not an option for the leading organizations of tomorrow. Financial institutions must play both defense and offense — and build in resilience and optionality from the outset — as the industry speeds ahead. To solve their key challenges and scale operations, decision-makers said it will be critical to:

- Build new digital products and services (62%).
- Leverage cloud-native services and archictectures (61%).
- Improve innovative processes to explore new ideas faster (57%).
- Experiment with emerging genAI use cases (56%).

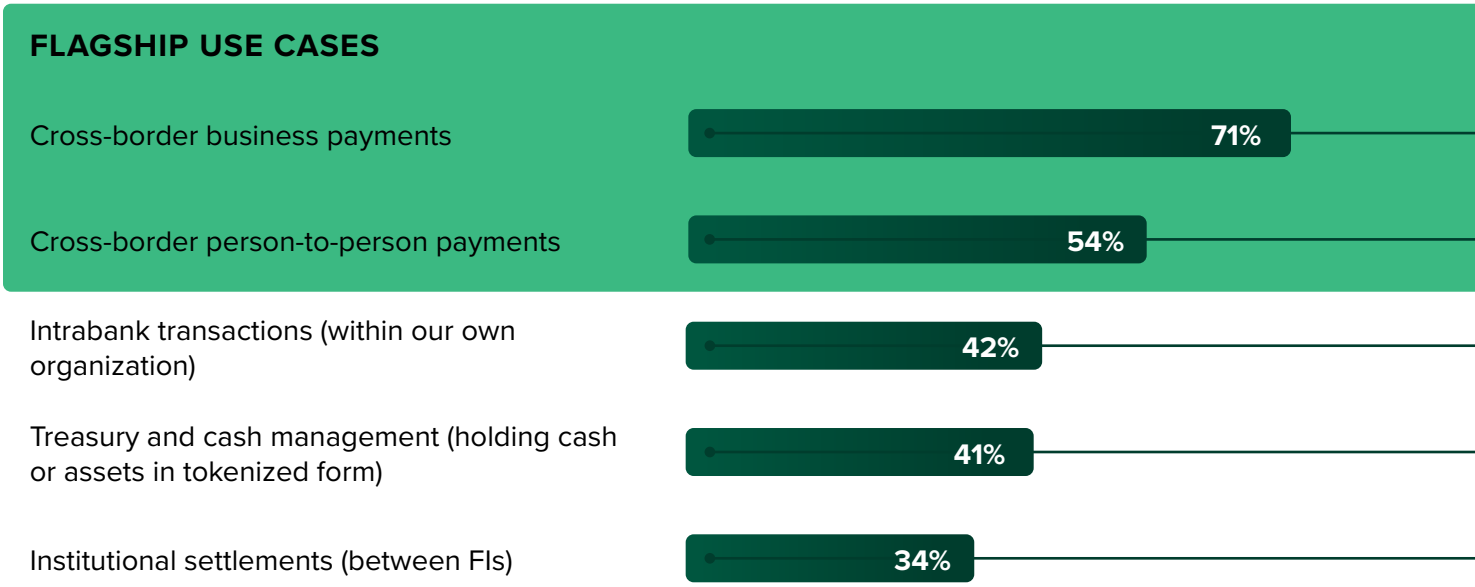

The 56% of the respondents who prioritize stablecoin adoption plan to increase their stablecoin investment by 25% or more this coming year compared to last year — underscoring a shift in priorities and market opportunity. The chief strategy officer for a fintech and technology platform in the UK said: "It's almost more a question of not how do we do this, but where do we even start? We have so many different ways that we could move some of our treasury on-chain." Respondents said the following stablecoin uses will be most impactful over the next one to two years:

- **Cross-border business payments.** Seven in 10 respondents (71%) cited cross-border payments to businesses, where existing solutions and systems are slow, costly, complex, and opaque (see Figure 5). The time is ripe for disruption, and stablecoins reduce settlement times from days to minutes, dramatically improving cash flow and liquidity and lowering costs.[9]

> "[Stablecoins are] a 24/7/365 rail such that you're no longer dependent upon multiple counterparties and correspondent banks within the flows."
>
> **CHIEF STRATEGY OFFICER, FINTECH AND TECHNOLOGY PLATFORM, UK**

FIGURE 5

"Which stablecoin use cases will be most impactful to your organization over the next one to two years?"

Note: Showing top five responses
Base: 521 global financial services decision-makers with responsibility for their organization's technology strategy
Source: A commissioned study conducted by Forrester Consulting on behalf of AWS Marketplace, April 2026

- **Cross-border person-to-person payments.** For 54% of respondents at FIs, cross-border payments to individuals will also benefit from stablecoins' capacity to increase speed, transparency, and liquidity while lowering the cost of doing business due to streamlined processes and reduced fees.
- **Intrabank transactions.** Two in five decision-makers (42%) cited stablecoin-enabled transactions made within an organization. This includes use cases that leverage asset tokenization to move money with greater flexibility, security, and traceability.

> "Stablecoins are already being used to reduce cross-border cost, but the bigger value is in the real-time liquidity and faster settlements."
>
> HEAD OF STRATEGY, BANKING, UK

- **Treasury and cash management.** Two in five (41%) mentioned holding tokenized assets as a complement to cash. This helps FIs with operations across regions and currencies. The chief strategy officer for a fintech and technology platform in the UK said, "[There's a] recurring pain point where you get what treasuries call 'trapped cash,' and that is a huge problem for them." Multinational organizations, for example, will use stablecoins as a settlement layer so they can repatriate funds away from areas with volatile currencies.[10]

- **Institutional settlements.** One in three decision-makers (34%) noted settlements between financial institutions, which can also leverage stablecoins to enable faster transactions and greater liquidity.

> "Maybe your wire takes two to five days. Stablecoins are less than 5 seconds. It can have trillions of transactions handled simultaneously — anywhere you can transact, at any point in time."
>
> **EXECUTIVE DIRECTOR, BANKING, US**

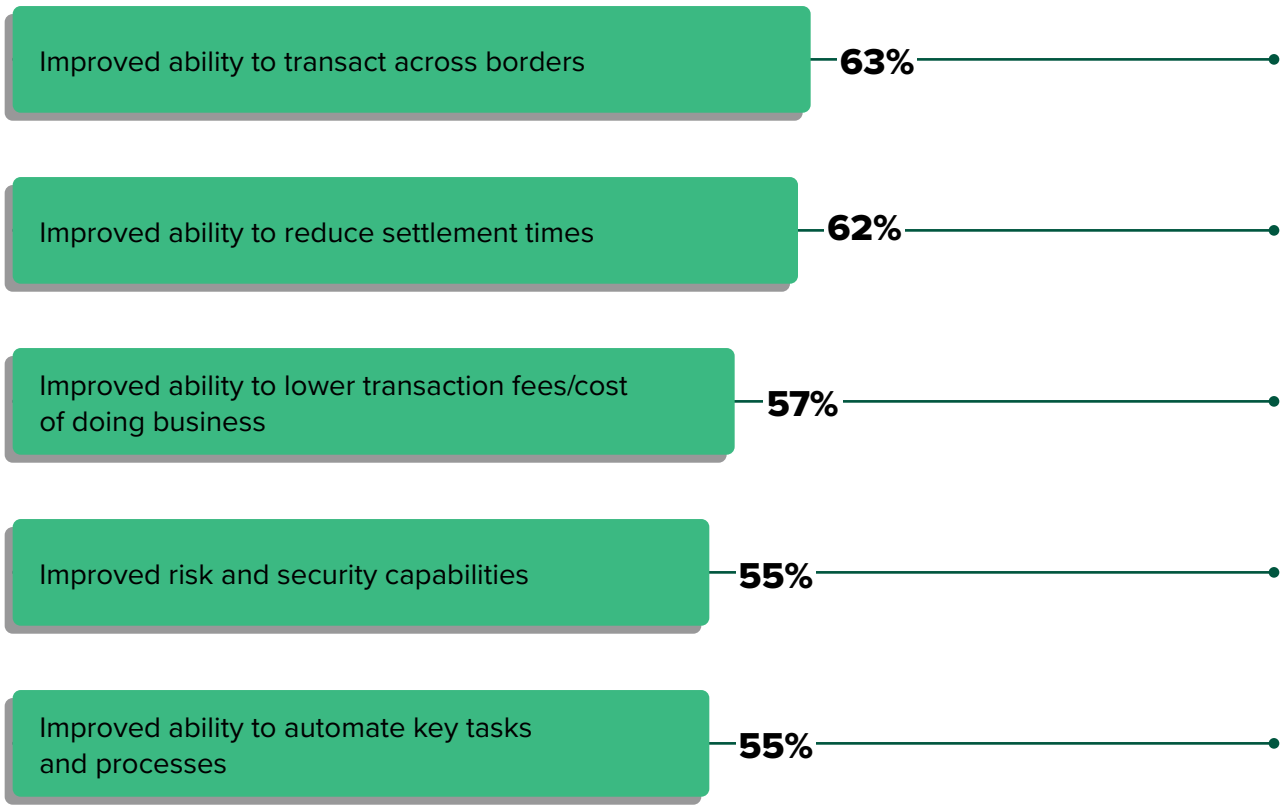

Financial institutions expect the investments that they're making into stablecoins to generate faster (and better) innovation, maintain privacy and security, and improve customer experience (see Figure 6). With greater regulatory clarity and stronger operational standards, stablecoins stand to become embedded into daily financial operations, providing interoperable and frictionless services on a global scale.

The stablecoin frontier is already materializing for organizations prepared to act. Organizations that fail to evolve risk losing a competitive edge as global payments and banking transform. Rather than waiting for adoption or regulatory certainty, success with stablecoins starts with a willingness to act today with the right guardrails and partner support in place.

> “[One bank] is looking at stablecoins from an institutional or liquidity movement perspective. [Another bank] explored tokenized deposits to enable real-time movement across jurisdictions to reduce funding costs and have a better balance sheet.”
>
> HEAD OF STRATEGY, BANKING, UK

FIGURE 6

Expected Benefits From Investing In Stablecoin Offerings Over The Next Year

THIRD-PARTY SUPPORT IS THE PATH TO OPERATIONALIZING SUCCESS

Financial institutions that thrive will move past deliberation to adopt stablecoins with intent. They'll also build in resiliency, an AI strategy, and mission-critical functions from the start, which will include trusted third-party support. Three in five respondents said they're placing a high priority on using third-party platforms and marketplaces to integrate their financial services (see Figure 7). Leading providers will offer industry know-how, scalability, data and analytics, and flexibility so organizations can compete.

> "There's no chance these groups are going to ever do anything in the [stablecoin] space unless they have a network of trusted third-party providers, but they also have to have a use case that is so explicit and so clearly causing pain in the organization that they can clearly cite an ROI on many fronts."
>
> CHIEF STRATEGY OFFICER, FINTECH AND TECHNOLOGY PLATFORM, UK

FIGURE 7

Organizations Require Support For Stablecoin Success

Note: Individual percentage values do not sum to total due to rounding
Base: 521 global financial services decision-makers with responsibility for their organization's technology strategy
Source: A commissioned study conducted by Forrester Consulting on behalf of AWS Marketplace, April 2026

Measurable results will also be critical. Proof of concept, clear demand, and the juiciest of use cases mean nothing without metrics tied to value (e.g., settlement times, cross-border liquidity). Before stablecoins can be viewed as anything resembling a silver bullet, organizations first need to understand the flow of funds. This is where trusted partners can place organizations ahead of the curve, helping to mitigate risk and innovate with the future of payments and banking at heart.

As the head of strategy at a UK bank concluded: “Organizations are looking and asking, ‘Who can help us scale this safely, meet the regulatory requirements, and integrate into our core system?’ It’s value versus cost.” They added, “An ideal partner is somebody that is scalable, has that agility, and a regulatory and a compliance grade to move from pilot to production.”

> “The winning cloud providers aren’t just enabling innovation — they are actually reducing the regulatory burden and managing the concentration risk, making it easier for banks to scale safely across jurisdiction.”
>
> **HEAD OF STRATEGY, BANKING, UK**

EXECUTIVE DIRECTOR, BANKING, US

"AI helps me in stablecoin demand prediction, which means AI can scan the data to guess how much digital cash I may need in my next hour. It is to that level of accuracy. It is like a smart thermostat for money, which will also give me real-time fraud detection and compliance cross-checks."

"AI tools are redesigning the old model of fraud monitoring, transaction monitoring, anti-money laundering, and know-your-customer (KYC) processes. Everything can be done in almost a real-time basis."

CHIEF STRATEGY OFFICER, FINTECH AND TECHNOLOGY PLATFORM, UK

"The capability of an AI agent system, a trusted one, to step in with the technology of a stablecoin on blockchain and the smart contracts associated with that, underneath that — you basically have what I believe amounts to a real sea change, not a step change, in the way that these treasuries can operate because you really start to remove 99% of the need for human interaction or human oversight."

"We work with a lot of nonprofits that are taking in Bitcoin and stablecoin donations and can, within 10 minutes, move them to wherever in the world to parties that are in trouble. If anything, the timing is almost good for the industry because [stablecoins] show up as a non-chaos creator and a controlling mechanism."

HEAD OF STRATEGY, BANKING, UK

"Banks will need to be more modular, data-led, and … scalable. In the next 24 months, banks are preparing to scale technology under tighter regulations and cost pressures, with priorities shaped around jurisdiction."

"[Financial services organizations are] looking at operational resilience. They're looking at stablecoin regulations … which means [they're] doubling down on data governance [for] third-party risk while continuing to roll out AI and customer outcomes throughout."

"[Partners] have to have the regulatory aspect. They have to have auditability. They need to integrate into the legacy core systems. They have to be able to modernize data platforms. Banks are avoiding rip-and-replace and looking at some of the API, modular, or cloud-natives that can integrate themselves into these systems and scale."

Key Recommendations

Forrester's in-depth survey of 521 financial services decision-makers about technology strategy yielded several important recommendations:

Identify use cases employing stablecoin as a utility that enables new or better products and services. Key aspects of stablecoins — including their always-on nature — mean leading financial providers can use them to decrease settlement times and costs while increasing liquidity. It is understandable that cross-border money movement use cases are by far the most widely cited among FIs, but there are far more opportunities including embedded finance products, programmable money for trade finance, and intraday liquidity optimization. The right set of use cases will inevitably vary by organization, but most FIs will benefit from stablecoin application beyond cross-border payments.

Use partners' infrastructure to scale both stablecoin and AI efforts. Executives and leaders at FIs know that actions from nonbank entities — especially regulators — are a prerequisite for stablecoin success. Another set of outside actors is also essential: strategic technology partners that provide the computing power and back-end infrastructure needed to scale both AI and stablecoin efforts. Hyperscalers in particular will play a crucial role in financial providers' AI and stablecoin initiatives, alongside core banking and engagement platform vendors.

Treat stablecoins and AI as utilities that expand and enhance your existing competitive advantages. FIs' AI and stablecoin strategies should be built around their preexisting assets — meaning their brand, distribution network, institutional knowledge, IP, and customer base — as core competencies and competitive advantages. AI and stablecoin capabilities should be treated as tools that change — sometimes fundamentally — how those existing advantages drive profitable business growth. Most FIs will not and should not become "AI companies" or "stablecoin companies" but instead should act as businesses that make the most of these capabilities.

Appendix A: Methodology

In this study, Forrester conducted customer interviews and an online survey of 521 global technology and business strategy decision-makers to evaluate the state of financial services organizations and their technology infrastructure. Survey participants included decision-makers in IT and line-of-business roles at the manager level and above. Questions provided to the participants asked about priorities, challenges, and future plans around stablecoins and their technology infrastructure. Respondents were offered a small incentive as a thank-you for time spent on the survey. The study began in March and was completed in April 2026.
