Onchain Finance in Banking and Payments

Banks, card networks and fintechs moved stablecoins and tokenised money into live use.

September 2026 Recap

PRAXIAL

Citi, UBS and other institutions plan a joint stablecoin issuer

Bank stablecoin consortium

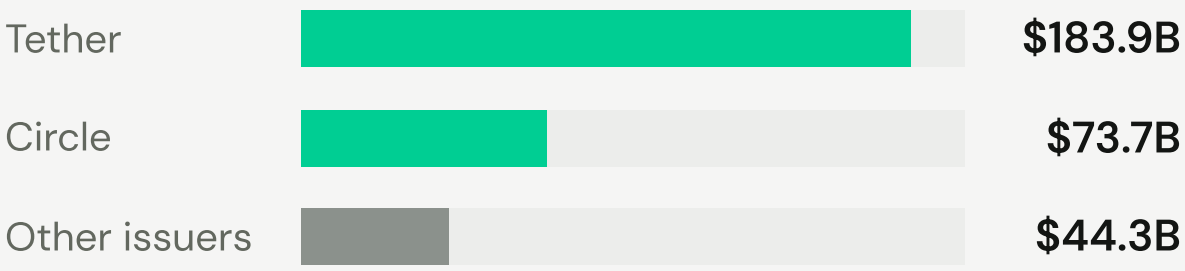

Bank of America, Citi, Goldman Sachs, Deutsche Bank, Santander and UBS are among 21 financial institutions committed to creating a joint stablecoin issuer for cross-border payments and digital asset settlement. They plan to establish the company in the second half of 2026 and launch its first dollar stablecoin in the first half of 2027. A euro stablecoin is a priority for later expansion. The announcement leaves the company name, token name and underlying blockchain unspecified.

Live bank payments test a shared ledger

Citi completed live dollar transactions with First Abu Dhabi Bank and OCBC through Swift's ledger. Tokenized deposits coordinate payment commitments across banks; existing real-time gross settlement systems still provide final settlement.

The pilot tests whether banks can agree a payment at any time without replacing their settlement infrastructure. It is a controlled proof of concept running from July to December, rather than a general service launch.

Stablecoins enter community-bank software

coinbase MOOV Stablecore

Coinbase announced integrations with Moov on 10 September and Stablecore on 16 September. Their software reaches more than 1,000 and 3,000 banks and credit unions respectively. The populations may overlap, and activation counts were not disclosed.

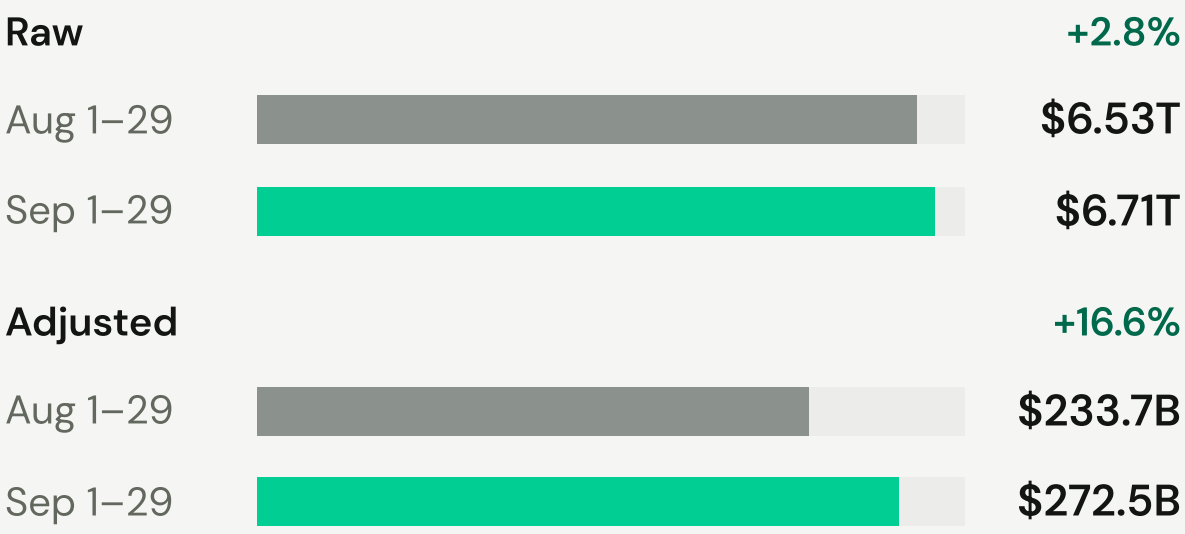

Existing bank software can distribute stablecoin services without each bank building the connection. Across the covered market, adjusted transfer volume grew 16.6% between the matched August and September windows, while raw volume grew 2.8%. Adjusted activity also includes investment and savings flows.

Tokenized securities settle in central-bank money

EUROPEAN CENTRAL BANK
EUROSYSTEM

The Eurosystem launched the core production service of Pontes, connecting distributed-ledger platforms to central-bank-money settlement. Thirteen market participants and four DLT operators were onboarded, alongside the Bundesbank in a market-participant role.

This gives tokenized asset markets a settlement asset with central-bank backing. It is wholesale infrastructure, separate from a retail digital euro. Extended hours and the full feature set are planned through 2028.

SoFiUSD goes live in card settlement

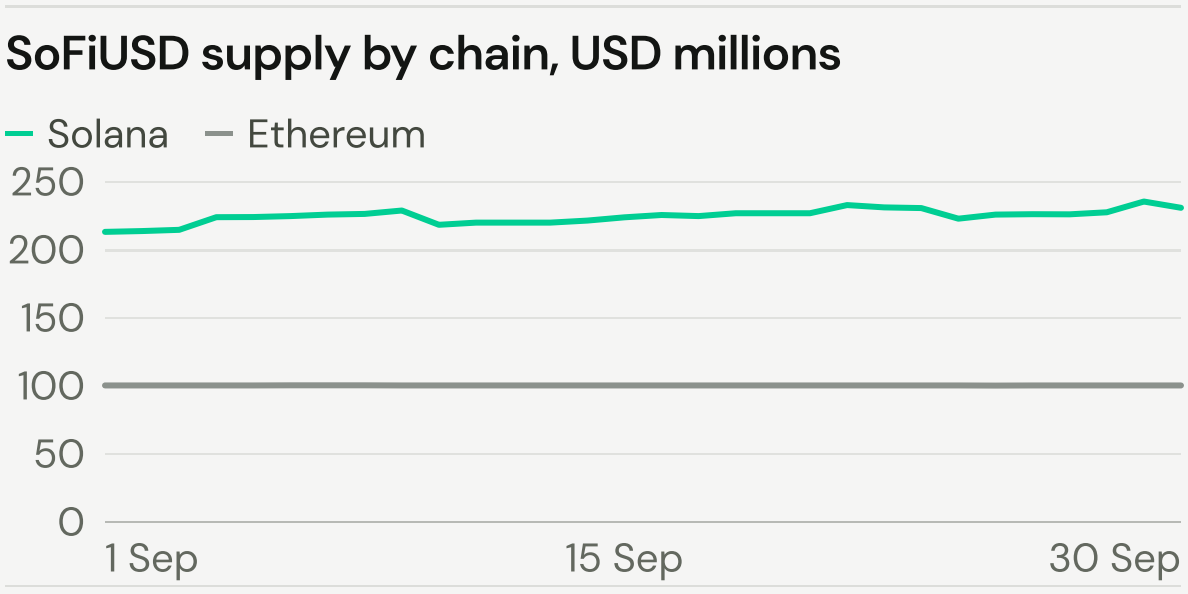

SoFi began settling its Mastercard debit and credit card obligations in SoFiUSD, its bank-issued dollar stablecoin. It is migrating the full card programme, which it expects to represent more than $25 billion in annualized volume.

SoFiUSD is a native fiat-backed stablecoin. On 30 September, supply was $100.0 million on Ethereum and $230.6 million on Solana. Issuance and token balances provide evidence of circulation, while Mastercard settlement volume still requires operator records.

Stablecoin-funded cards expand through Reap

VISA REAP

Reap and Visa announced an expansion of stablecoin-linked credit card programmes to more than 100 markets, subject to local regulation. Customers can use stablecoins as collateral or for repayment while merchants receive ordinary Visa card payments.

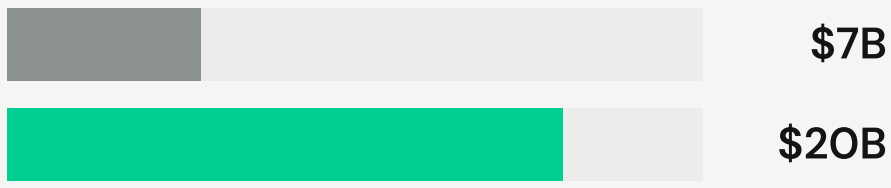

The new reach concerns Reap's card programme. Separately, Visa disclosed a $20 billion annual run rate for its global stablecoin settlement business. That network-wide figure cannot be treated as Reap's volume.

Bank deposits pay when conditions are met

UK Finance with seven UK banks

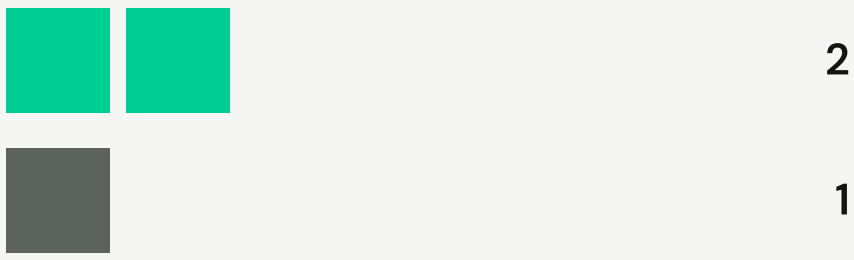

The Great British Tokenised Deposit pilot completed its first live customer transactions: two remortgage completions and a consumer marketplace purchase. Tokenized bank deposits were locked and released when the agreed transaction conditions were satisfied.

The test concerns payment control, rather than a new publicly traded coin. It shows a bank deposit being used for conditional settlement while retaining the protections of bank money. Seven banks participate in the initiative; the release does not attribute every live transaction to every bank.

A branded financial app with stablecoin funding

Whop

Whop released a neobank blueprint for branded balances, virtual cards and payouts. Whop operates the underlying accounts and payment services. Businesses can set their interface and commercial terms, with funding supported across 11 chains and around 20 tokens.

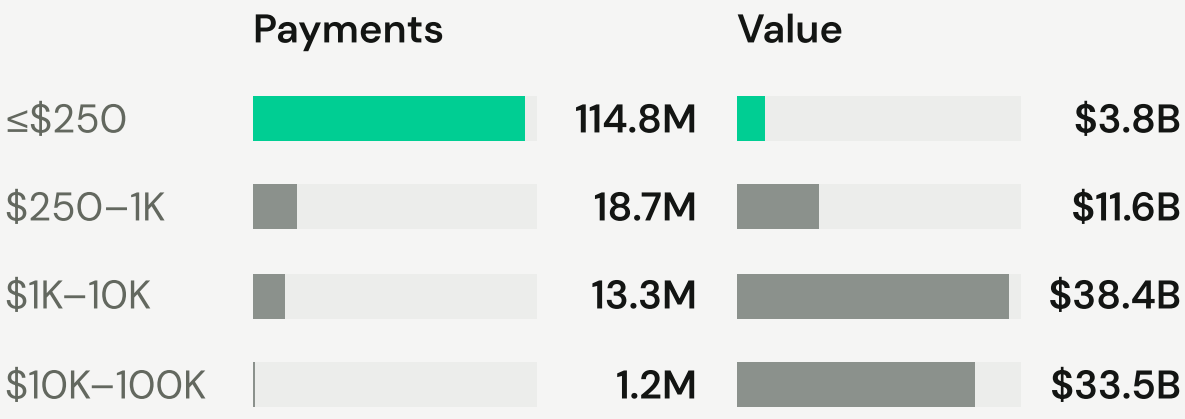

The wider market shows how payment counts and value differ. In September, 114.8 million payments of $250 or less were worth $3.8 billion. The $1,000–10,000 band carried $38.4 billion. This market distribution gives context for the product without establishing Whop adoption.

Bank accounts and checkout connect to stablecoins

citi coinbase

Citi and Coinbase expanded their collaboration in two directions. Coinbase Virtual Accounts use Citi banking infrastructure to convert incoming fiat into stablecoins. Spring by Citi merchants can accept stablecoin payments, with Coinbase converting the funds to fiat and Citi settling them.

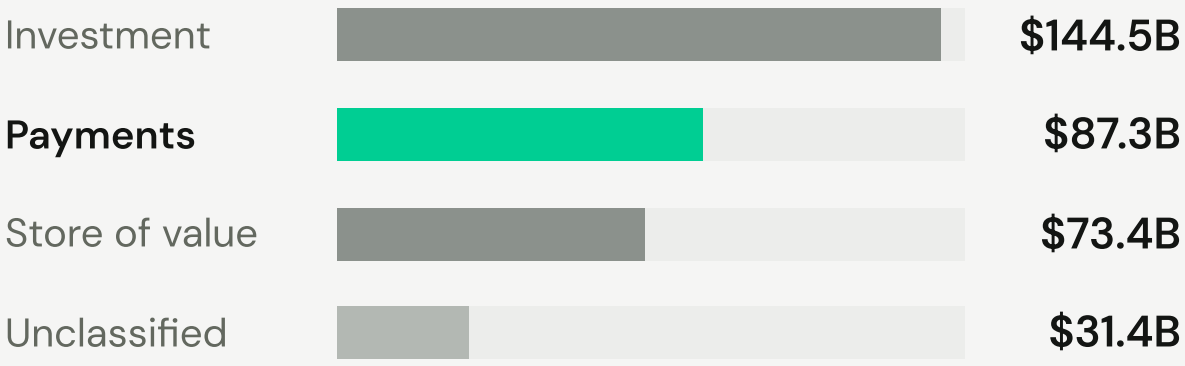

The collaboration places conversion inside business accounts and merchant checkout. $87.3 billion of September activity was classified as real-world payments, or 28.6% of classified value. Investment and savings activity still account for most classified flows. The data cannot isolate Citi or Coinbase merchant usage.

Open USD goes live with Visa, Mastercard, Stripe, Coinbase and Shopify

Open USD | operated by Open Standard

Open Standard launched Open USD (OUSD), a dollar stablecoin issued by Bridge, a Stripe company. Its five founding partners are Coinbase, Mastercard, Shopify, Stripe and Visa. OUSD went live on Base, Ethereum, Solana and Tempo, with business access through Stripe, Mastercard's BVNK and Visa. Coinbase access follows on 1 October.

Businesses can mint and redeem OUSD at $1 without an issuer fee. Partners earn rewards tied to the supply and activity they generate, giving payment platforms a financial incentive to integrate and promote the token.
